

## barry walley

because of the situation of major sediment deposits behind the Conowingo Dam, it is imperative that the water in the Delaware River and the waters that make up the basin are not ecologically compromised. The water from the Susquehanna river, along with the water that makes up the Delaware basin, all flow into the Chesapeake bay. The ultimate destruction of these waters would have catastrophic and irreversible consequences. I fish these waters and have witnessed, at this point in time, ecologically all seems well. Both the Delaware and the Susquehanna have stable numbers of shad, musky, stripers, walleye, white perch, catfish etc. Eagles, osprey, and otters are residents of these waterways. Practices like fracking, waste dumping, and lack of knowledge, can quickly destroy these natural resources which are so vital to the preservation of life itself. Common sense and not corporate nonsense need to be utilized. Make the right decisions for generations to come.
