

Dorothy Daniela Gioseffi

It is insane to consider fracking in the Delaware River Basin. We are now in the Age of Climate Crisis Emergency and cannot afford more methane or wasting of water, or toxic waste dumping of waste water, and all the terrible things that happen from fracking from earthquakes to the shifting of plates that can open up sink holes to poisoning of ground water aquifers, there is NO excuse to allow fracking in the Delaware River basin. It would be nothing short of criminal to allow fracking and NJ has a big water problem in the near future. A fair amount of NJ water comes from the Delaware River Basin. We cannot afford risking the area for any non-environmentally safe reasons. It is high time to be thinking of saving the planet for the young and stopping all these nefarious doings of fossil fuel companies. Methane from fracking is a highly toxic greenhouse gas. Areas where frackig has occurred have been poisoned. That is evident.
