

Ann de Vitry

The industry and its lobbyists continue to insist the process of fracking is safe. This is clearly far from the truth. Individuals continue to be at risk due to exposure to dangerous toxins. As reported in scientific studies, these toxins are carcinogenic and are also known to be endocrine disrupters and cause neurotoxicity. The dangerous process of fracking is impacting our water, air and soil and has been linked to increased cases of cancer among people living near fracking operations. This is a dangerous assault on the earth and it needs to be stopped now! When your priority is money over health and safety, we are on an extremely dangerous and destructive path that will continue to harm many more individuals.
