

## Mark Zolandz

I support regulatory efforts to ban hydraulic fracturing in the Delaware River basin. There are numerous examples of hydraulic fracturing activities that have negatively and irreversibly impacting ground water and drinking water sources for local residents. Companies are not required to disclose the chemicals used in hydraulic fracturing, so citizens are exposed to unknown chemicals and unknown health risks. We need to protect our drinking water sources, including ground water and aquifers, for our generation and for future generations to come. While economic growth is important, there are other industries that can bring jobs and money into local economies, including installing solar panels on buildings and on solar farms. We need to choose clean energy sources for our future, and we need to ban hydraulic fracturing in the Delaware River basin.

Thank you for standing up and protecting the health of local citizens.
