

Doug Seidman

Fracking is a dangerous process that both wastes and contaminates huge amounts of water. It is important to conserve pure, drinking water, not to waste it. Fracking also causes dangerous chemicals to be used and to leach into our groundwater.

There are safer ways to get energy than hydraulic fracking and they should be used first before resorting to fracking. We need to think of our planet and its safety and health over centuries, not just for some short term economic gain.
