Wyoming Department of Environmental Quality
Water Quality Division
Mr. Bill DiRienzo, WYPDES Manager
200 W 17th Street, Suite 200
Cheyenne, WY 82002

Re: Comments to Renewal WYPDES Permit WY0002062

Dear Mr. DiRienzo:

Aethon appreciates the opportunity to provide the following comments on the above mentioned draft permit:

- 1) The draft permit adequately satisfies applicable regulations, specifically:
 - a. Wyoming Water Quality Rules and Regulations (WWQRR) Chapters 1 and 2, inclusive of the very important considerations in Appendix H: Additional Requirements Applicable to Produced Water Discharges from Oil and Gas Production Facilities
 - b. Federal regulations contained in Subpart E of 40 CFR § 435 for Effluent Guidelines and Standards for Point Source discharge associated with Oil and Gas Extraction
- 2) The draft permit is more protective and compliance requirements have been significantly increased compared to previous permit authorization for these discharges, specifically:
 - a. the proposed chloride load limit of 719 tons/month is less than chloride loads discharged prior to January 1, 2013
 - b. TDS, chloride, and sulfate have end of pipe concentration limits proposed for all outfalls whereas prior to this renewal, limits for these constituents were not established at the active outfalls
 - c. all discharging outfalls are proposed to have extremely extensive analysis conducted quarterly and several new constituents are in addition to those specified by the WWQRR Chapter 2 permitting application (e.g., BTEX, Thallium, Total Ammonia, Nitrate, Phosphorous, Orthophosphate Phosphorus)
- 3) The Statement of Basis should clearly state that this permit renewal authorizes less untreated discharge and less pollutant load per month than was legally authorized and discharged prior to January 1, 2013.
- 4) Aethon supports establishing Chloride and TDS concentration limits equal to the average untreated historic data such that the water quality being discharged in the future will be equal to or higher quality than has been legally authorized to discharge for decades. The draft permit proposes flow-weighted compliance calculations and Aethon proposes the limits be based on flow-weighted calculations.
 - a. Attachment 1 provides historic DMR data and calculations

- 5) Aethon proposes the following adjustments to the Latitude and Longitude coordinates on Table 1:
 - a. Outfall 016 (to be constructed) should be in accordance with the final pipeline alignment and corresponding location of the proposed stilling well; 43.20953 and -107.55012
 - b. WRC1 monitoring should be conducted at the same location as the Class I baseline sampling that occurred from 2010-2016; 43.433456 and -108.178522
 - c. BWC1 should be consistent with Side ID 9 for the Alkali and Badwater Creek Sampling and Analysis Plan; 43.261799 and -107.675704

- 6) The monthly load limits that utilize Flow Case 01 for calculations are overstated and theoretically unachievable as they assume 68,000 bpd (2.856 MGD) is untreated. Considering chloride is the most limiting constituent and averages 2,419 mg/l, the maximum untreated discharge will be 56,255 bpd (2.36 MGD) which is considerably less than historic volumes that were discharged untreated.

- 7) Aethon proposes toxicity testing for aquatic species be performed at locations in geographic proximity to actual aquatic presence and in correlation with the Use Attainability Analysis on Badwater Creek. Aethon's discharge initially enters Alkali Creek (ephemeral) providing beneficial use for wildlife and livestock. Data collected from Control Reach 2 of Alkali Creek Channel Stability Monitoring (upstream of Aethon's discharge) supports the absence of flowing surface water through years of quarterly monitoring events. As explained in the permit Statement of Basis, Alkali Creek is effluent dominated and is not considered a high class water. The Badwater (perennial) confluence, specifically instream monitoring point BWC1 or the Alkali Downstream Monitoring Point (DMP1) are locations where aquatic toxicity testing would be appropriate considering non-game fish inhabit some segments of Badwater.

- 8) The following excerpts in blue font and underline are proposed revisions to the toxicity testing permit language (acute section comments are a-e and chronic section comments are f-j):
 - a. Upon issuance of this permit, the permittee shall, at least once annually, conduct acute static/static renewal toxicity tests on grab samples of the discharge. The static/static renewal toxicity tests...
 - b. ...as set forth in 40 CFR 136.3 and the most current edition of "Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms, EPA-821/R-02-012"
 - c. ...an acute 96-hour static renewal toxicity...
 - d. Acute toxicity occurs when the LC₅₀ (defined as the lethal concentration to 50 percent of the test organisms) is equal to or less than 100 percent effluent.
 - e. The format for the report shall be consistent with the most current edition of "Methods for Measuring the Acute Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms, EPA-821/R-02-012", and...
 - f. Upon issuance of this permit, the permittee shall, at least once annually, conduct chronic static renewal toxicity tests on a grab samples of the discharge. The static/static renewal toxicity tests...
 - g. ...as set forth in 40 CFR 136.3 and the most current edition of "Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms, EPA-821/R-02-013".

- h. Chronic toxicity occurs when [the IC₂₅ value \(defined as 25 percent inhibition of test organism survival and growth\) is equal to or less than 100 percent effluent.](#)
 - i. If a test acceptability criterion is not met for control survival [or](#) growth
 - j. The format for the report shall be consistent with the [most current edition of "Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Freshwater and Marine Organisms, EPA-821/R-02-013"](#), and...
- 9) Typographical errors are located on Page 5 under Category I, "The main reason that chloride is the most limiting is because chloride has to overcome the greatest dilution of the parameters, diluting from a 2,000 mg/l..." the value should be 2,419 mg/l. The same error occurs within the footnote below the Table listing Flow Cases.
- 10) Regarding Part I, Section A, the tables of constituents and associated limits should specify required analytical methods and whether metals analysis is total or dissolved.

Aethon appreciates your consideration of these comments to the draft permit. Responsible resource development can continue to coexist with carefully permitted authorizations that protect downstream designated uses. Aethon believes this draft permit has been structured with a thoughtful compliance and monitoring program that will achieve that balance.

Sincerely,

AETHON ENERGY OPERATING LLC

Andrea Taylor, PE
Regulatory & HSE Manager

Enclosure, Attachment 1

Attachment 1

Monthly DMR Data (Nov 2010 - Apr 2019)

		avg TDS	avg MGM	# of TDS samples	avg Chloride	# of Chloride samples
