I can't believe this is even a possibility! When you read through the list of pollutants and poisons, who would ever allow any waste water from oil and gas production, to be dumped into a reservoir, that is used for DRINKING water and game fishing???

Where is the logic in that? There is none. It's a move to save the oil and gas companies millions they should have to spend for cleaning up the by products of their operations.....to many others are being negatively affected when these companies don't take responsibility for their action!

These companies need to remove the waste water and not dump this anywhere! Take it and store it as they should. Fracking should not be proprietary in nature. Every single substance needs identification for the problems it can cause humans and wildlife.

Do not allow this company to dump its waste into our drinking water!

Do not allow this to happen.
