

Department of Environmental Quality

My questions are:

One of my greatest concerns is about industrial hazardous materials being ingested by humans through their water and food source.

1- Have soil samples been taken from out fall points, and evaporative leachate fields, and if so, what was tested for, and what were the concentrations ?

2- What is being done to prevent cattle destined to enter the public food supply, from drinking and eating tainted food sources in the hazardous waist drainage's?

3- What are the ramifications for an oil company if found to be a point of source in polluting a major waterway ?

5- What is being done with fracking and drilling hazardous waist?

4- What are the ramifications for an oil company if found to be out of compliance?

6- If the oil company is self monitoring what is being done to verify their results?
