

Climate Reality (Leadership)

The essentials are here jobs, industry movement and money. The lack of foresight is missing. In the long run the water is contaminated and a natural resource depleted from our earth. A natural resource which we can go without using by finding renewable energies like solar and wind. Wow Wind! The new commodity can generate electric turbines for external battery storage which can be held for later use in lean times or resold.

While other communities are jumping on board with the Paris Agreement it is in light of some opinions still on the table for Americans to agree upon. We do not have the option of pulling out of the agreement until end of December 2020. By then an election will occur. At any concern what is more important here our immediate pocket books or lasting water for future generations? It is clear water is more essential to sustain our existing way of life. Are we good stewards of our land? Do we count the cost now or later when there is no choice for our offspring? We I hope are good stewards of earth and We must We can and We will change. The outlook to the Climate Reality Crisis needs a profound shift for the better.

Thank you

Steven L. Sanchez
