

## Karin Keller

Why would you even consider a fresh water system being okay to dump millions of gallons of oilfield waste water into each day a solution to a problem the oilfield creates?

This is a fresh water system that flows into other states and ends up in the ocean.

So why do you feel this is the solution?

These waters support wildlife, marine life, farms, fields and are used for recreational purposes, they also support human life.

The purposed waste water dumping Will flow down stream polluting the water system that supplies farmers water for the fields they plant for the food people and livestock will eat. It will contaminate the land as well because of this, polluting every living species from Wyoming to the Gulf of Mexico. Then if that's not enough it Will contribute to our already over polluted oceans.

So again Why would you even Consider this a solution to the oilfield Waste Waters? The key word is Millions of Gallons of Oilfield Waste Water per Day being Dumped into a Fresh Flowing River System that supports ALL living creatures including US humans!!! Find a different solution, to this man created problem that doesn't include poisoning ALL Life!!
