Please DO NOT allow this pollution to enter Boysen Dam unless you have the ability to force the polluter(s) to clean up any future health problems. It's a bad idea to gamble with public health, recreation, agriculture water needs and monies already spent on creating Boysen Dam. Given the unknowns of climate change, if Wyoming enters into long periods of drought, the concentrations could increase dramatically. Then citizens of WY, maybe the state could get national support...maybe not, would be left paying the health and remediation costs for clean up. If remedying is even possible. Your decision today could be a lasting legacy of liability which benefits one industry who will walk with the profits. Boysen Dam is a WY asset, let's keep it that way with great future potential. All life needs water. Thank you for your consideration and hard work.
