

Zachery Eaton

Suck it up and use injection wells. It's not like they can't afford it. I've worked in the oil fields of Wyoming for 10 years. I've had to haul produced water as well as treat produced water for what they call TDS, these methods are effective but only under close monitoring which sounds good but it's not easy to keep the levels of contaminants under control. Use of chemical treatments in combination with injection wells to protect our natural water ways in Wyoming as well as down stream is a much better solution to this problem than just dumping it into our lakes, rivers and streams
