

Jeff Baltezore

I think this project could be a huge boost to the economy of not only Fremont, Hot Springs and Natrona Counties but the whole state. I get the water issue but why is the Neptune treatment facility never mentioned in these articles? Is it not going to be used? Does it not have the capacity to handle so much water? There are plenty of safe ways to treat water for surface disposal! I have been in the oilfield over 27 years and have dealt with water disposal and treatment. There are ways to make this work!

While we're at it maybe there's potential for a natural gas fired power plant? Utilize the gas and water and tie into the power grid at Boysen Dam? Using the water to produce steam for a power plant would essentially distill the water therefore removing the salts. This in addition to the Neptune facility would most likely be more than enough to clean up the water.

Maybe I'm dreaming but why can't we dream bigger?? Utilize our resources and send out electricity. Cleaning the water producing power and adding many many jobs in the process! Let's explore safe avenues and increase the revenue in our great state!
