

Len Fortunato

While working for Emerson Process Management, I was following the original plans by Encana to find a water processing design that would properly process well water that BLM would approve. A BLM approved RO design was found and Encana built the plant. I was evolved in setting control valves and regulators for the project and visited the pland many times. As far as I know the plant was succeeding in removing dissolved salts. Later, most of Encana's assets in the Wind River area was sold to Aethon. The technology exits to process the well water so DEQ should require Aethon to process ALL produced water. Aethon can still make a profit while treating water.
