Thank you!

Washington Department of Fish and Wildlife

I usually write my own letters but I really cannot improve on what this organization has done here. It seems complete to me, and expresses my thoughts and beliefs perfectly. We must learn to love in a world where all creatures are allowed to flourish, or we will end the morality of our existence and descend into evil. And we have been doing just that, for years.... Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Sharon Sharon
Feasterville Trevose, PA 19053

Washington Department of Fish and Wildlife

Wolves are intelligent social animals deeply interwoven with our species. As a biologist and wildlife photographer, and as a person who cares deeply about our national heritage, I ask you to rethink your approach to addressing wolf populations. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Carol Carol

Washington Department of Fish and Wildlife

My family and I as well as groups of travelers from our area, Upstate NY, actually plan trips to your state for the specific purpose of hoping to see wild wolves. Please be proud of the fact that YOUR state has wolves! You should be honored to have them. Please, you can certainly find and consider non-lethal methods of reducing conflicts. Wolf recovery should be encouraged in your state.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. A number of new studies have shown that wolves play a critical role in the overall health of completion biospheres as a key link in a chain of complex events and interworkings scientists are just now beginning to understand.

We must maintain vigilant protection of wolves. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Washington Department of Fish and Wildlife

Wolves are an extremely important trophic cascade species as has been witnessed in Yellowstone area. In Washington, they have yet to fully recover from being endangered. I hope that WDFW will not rush into declaring them no longer endangered and will allow them to fully recover and stabilize their population. That is going to take some time, their population numbers are far from meeting the goals set forth in your present plan, so I am confused as to why WDFW is already considering making post recovery plans. In assisting the recovery of wolves, attention would be far better spent working out and implementing plans to resolve conflict issues with livestock owners, resolutions that would not be lethal to the wolf population. Many countries have found ways to do this. In the Himalayas, the endangered Snow Leopard is recovering through a well thought out plan in dealing with livestock conflict issues. You might consider contacting WWF to learn of ways to save populations that can be predators of livestock.

One of the most effective aspects of the success in the recovery of Snow Leopards was from educating livestock owners on their importance. Why haven't you had outreach public education? I believe that this is part of the mandate of the current plan but I am unaware of you implementing such a program. Are you not aware that the single most effective method of increasing population numbers of predatory endangered species is through educating the public? But instead, I've learned that you are considering wolf killing. I frankly feel that either your department has been lazy or it is simply understaffed. Education is the key for this species to fully recover. You could educate livestock owners on the critical ecological importance of wolves, help them to appreciate the need for this species. Please stop planning ahead for a possible future. Instead work on your present program. complete it by educating yourselves and livestock owners. Please prioritize wolves over livestock. If you don't implement the education mandate, the public will fail to appreciate this most unique species. It will fail to see any reason to co-exist with wolves. And the Wolf Recovery program will fail.

Thank you for considering my comments.

Sincerely,

Joanne Joanne
Seattle, WA 98115

Washington Department of Fish and Wildlife

It is important to recognize the unique role that wolves play in our environment, and to commit to a plan that will preserve that role. Wolves, as apex predators, help preserve our forests and wild lands so that all species can live in balance. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Using planning to help prevent conflicts between livestock and wolves, recognizing the need to accommodate wolves in their habitat and compensating ranchers for livestock that is lost to wolves; (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to look at scientifically established facts on wolves and the role they play in nature, and to move with impartiality toward a compromise that will accommodate these ecologically important species. Thank you for considering my comments.

Sincerely,

Jane Jane
Wilton, CA 95693

Washington Department of Fish and Wildlife

In my opinion, it is too early to create a “post-recovery” plan for wolves, as Washington is still far from meeting the goals set forth in the current plan. Instead of creating a post-delisting plan, WDFW should focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

As a resident of the Methow Valley, where Eastern Washington’s first pack established itself, only to fall prey to cruel poaching, I can assure you there is a great need for more education. The people who want to be able to kill wolves still think of them as wanton, out of control, mindless killers.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Pat Pat

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. (4) When wolves were re-introduced back into Yellowstone NP, their presence brought the ENTIRE ecosystem of the park back into balance. The only ones negatively impacted are cattle ranchers who are grazing their herds on OUR public lands!!! Thank you for considering my comments.

Sincerely,

Eilene Eilene

Washington Department of Fish and Wildlife

I was living in Eugene, Oregon, when the first Idaho wolves traveled into the state. I now live in California, where Oregon wolves now live. It is thrilling. I feel as though these wolves belong to me, no matter where they travel. I welcome them back, am on the Oregon and California email lists that report on the wolves' activities, and am a vegetarian. So I firmly believe that the Washington Department of Fish and Wildlife should focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. You must educate yourselves about the importance of top predators, and then use every opportunity to educate the public. We're only a month away from 2020. Stop thinking like people who lived in the 1820s!

Sincerely,

Joanne Joanne

Washington Department of Fish and Wildlife

WA doesn't have that many wolves, and we're culling them for the sole benefit of ranchers who are intentionally moving cattle onto public land every year where there is known conflict. There is no meat shortage in America, so "Feeding America" has become more about increased revenue and supplying other countries, where much of the increased production is going. We have enough meat, and ranchers have enough revenue. The American taxpayer is under no obligation to make ranchers wealthy. They continue to receive very cheap rates on taxpayer owned grazing land under the outdated guise that they can't make enough money to operate, and therefore can't provide needed food for our citizens. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Please protect wolves in Washington and throughout the United States. Wolves have lived on this continent longer than humans, yet humans have taken nearly all of the land for their own use. Instead of killing wolves, why don't we give them the land to live as they should. They are only trying to survive. Why should they be punished because humans have taken nearly all habitat away? We created this mess, and it is our chance to make it right by protecting wolves and giving wolves the habitat they need to survive. Thank you for considering my comments.

Sincerely,

Marybeth Marybeth

This is a new era. People care about the environment and we are willing to go the extra mile to advocate for it. Have you noticed the uptick in rallies across the world that are calling attention to Climate Change, saving the Endangered Species Act, halting Gas & Oil exploration, halting Pipeline construction, etc. etc. etc.???? We, the people, demand that all creatures live together on this earth without fear of death or dissemination.

This has to be accomplished through listening and BELIEVING the experts/scientists (who are credentialed!) It has to happen with education. And it has to happen with full backing from the departments that oversee each and everyone of these issues. The Washington Dept of Fish & Wildlife has a duty to put fish and wildlife FIRST. This can only be done if the department stays out of the pockets of politicians/wealthy businesses and keeps their eyes on the overall recovery of any endangered species and all habitats whether endangered or not. Which means, this department can not go rogue and operate under the radar at their discretion. There has to be full transparency. These predators are essential to our ecosystem. They are not a detriment to the livestock industry if all measures are taken to listen to the scientists and educate ranchers and the public. Playing into those fears is not the answer. The wolves have not met the criteria to be de-listed. Give them a chance for full recovery and do everything you can to support their right to life!!

Sincerely,

Tawn Tawn

Washington Department of Fish and Wildlife

Maintaining wolves in our environment is very important to the way in life of Washington state. I understand the economic impact on ranchers when their livestock is killed, but we need to support other methods (rather than just killing to handle this issue.) My Father raised cattle for years in Spokane, so I am familiar with the challenges a rancher faces. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Tonya Tonya
Port Townsend, WA 98368

Washington Department of Fish and Wildlife

Wolves are important members of an ecosystem. Please look at what happened in Yellowstone. When wolves were reintroduced, they kept the deer, elk, etc., populations in check allowing vegetation to recover. Trees and other types of vegetation were able to grow without being browsed out, thereby stopping erosion into streams. The streams recovered and attracted other types of wildlife.

The balance was restored making the ecosystem richer and more diverse.

The goals of the current plan haven't been reached. The Washington Department of Fish and Wildlife should focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Washington Department of Fish and Wildlife

I have followed the return of wolves to WA State closely because I have been interested in wildlife and its role in healthy ecosystems all of my life. My favorite activity is hiking where wildlife watching is good. I have also followed WDFW's management of wolves in WA and I tried to participate when the Profanity Peak Pack was killed in 2016. I am very familiar with WAG and non-lethal deterrence measures that work and do not work in WA State. I try to read wolf research and stay informed about what is going on with wolf management in WA State. WDFW should be focused on fixing the problems in the Protocol for Wolf and Livestock Interaction, not post recovery, until it solves the problems in the Kettle Rang. Look at the statistics - of the 30 wolves WDFW has killed, 26 wolves were killed for one rancher, 4 packs, 3 successfully breeding packs, all for one rancher. So far, WDFW has killed all of the wolves who have tried to live on one rancher's 80,000 acres of great wildlife habitat. The draft, revised Protocol doesn't address the problems in the Kettle Range. WDFW and most of the public knows this. Have open houses for us. The public comment period on the Protocol was not well advertised, it happened in the summer when many of us were gone, and it was before the OPT Pack was slaughtered. Let the public comment on the Protocol - we will tell you what is wrong with it. Solve this problem because we are not ready for post wolf recovery until the issues in the Kettle Range are resolved.

Start using the "best available science" in the Protocol - for deterrents and for lethal removal. What science supports WDFW's statement that it hopes to "change pack behavior" when it shoots a a wolf or two or more from a helicopter? How does removing most but not all carcasses, some not until they are largely consumed, how does this work as a deterrent? When will ranchers need to document how and when they use deterrents so the public knows if our public money is being spent on something that might work? Instead of worrying about post-recovery, it is obvious that WDFW needs to do a lot more education on how to live with wolves. Wolves are being shot by ranchers and hikers who say they are "afraid", when many other options were open to them - such as leaving the area, using bear spray, and learning the facts about wolf behavior. As a person who spends a lot of time hiking in Yellowstone, I know wolves do not pose a huge danger and I know non-lethal ways to deal with fear like walking away or using bear spray. Hikers in Yellowstone are in grizzly habitat and we aren't shooting anything! How much education has WDFW done in wolf country, and with hikers and ranchers? Is bear pray and teaching its use being promoted as it is in Yellowstone - and Alaska - and Montana with hunters in grizzly country? Finally, when post-recovery is discussed, I hope it is done very differently than the process used for writing Protocols. 1. First and foremost, open up the process to the public and to wolf and livestock experts. WAG is the wrong group to use in this effort. 2. Use the best available science", not science picked by WDFW to support what it wants to do. Open this up to the experts in wolf behavior. Go beyond WDFW and have an unbiased panel of wolf experts 3. Educate the public on the role of apex predators in healthy ecosystems. Hunters and ranchers esp. need to appreciate this. Too many hunters still think they are a good replacement for wild predators.

4. Manage wolves for the 97.58% of the people in WA State who do not buy hunting licenses and probably the large number who do not own ranches. Unfortunately the 2.42 % who hunt dominate WAG as do ranchers. Many if not most people in WA State view WDFW as an agency that serves folks who hunt and fish. For proof, look at the main interests of folks chosen to be on WAG.

Thank you for considering my comments.

Sincerely,

Martha Martha

Davis, CA 95618

Washington Department of Fish and Wildlife

In your approach to Washington's wolves, you are failing at every level that is conceivable. They are not recovered yet. You must understand, and you must educate the public to understand, that predators such as these endangered wolves, are very important to their ecosystems; they are neither enemies nor reckless livestock-killers. Having a field day with wolf-killing serves the purpose of childish action-and-revenge fantasies, but no rational purpose.

Sincerely,

Kenneth Kenneth
Salem, NH 3079

Washington Department of Fish and Wildlife

Why are we destroying life that has every right to be here? It is absurd as it will lead to our own species destruction in the end. Life evolved hand in hand with each other and together forms the web of life. With the loss of each species a strand of the web is broken. At some point it will give suddenly and completely.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Washington Department of Fish and Wildlife

Let's not get ahead of ourselves here and act as though the wolf population in this state has achieved some great level of recovery. As long as we have regressive politicians in office who are more interested in pursuing their narrow agenda than doing the will of the constituents whom they serve, there will continue to exist a conflict of interest. Catering to the whims of politicians (especially the current administration) and special interests (such as ranchers) is to curry favor to a small group of narrow-minded people who miss the larger picture. I would hope you don't succumb to this stupidity masquerading as sound policy.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. I am a wildlife enthusiast. I love to watch and photograph wildlife in their natural habitat doing their natural behaviours. Wolves are such beautiful creatures that have a very social and complex structure to their groups. These wonderful animals should be lived with and not us vs them mentality. Stop letting the meat industry dictate what is right for them and instead let SCIENCE dictate what is right.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. 4) This is an important program for our wolves and our ecosystem. Stop listening to special interests groups!! Thank you for considering my comments.

Sincerely,

Chris Chris

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. owned and lived with a wolfdog .I had a wolfdog as a pet for many years. She was 90 percent wolf and 10 percent dog. These creatures are gentle, loving, and reliable when treated appropriately and trained well. They really love their packs and care well for their young. They are very important in the wild and help balance of nature. There is no reason for cattle ranchers to just continue killing these animals for being themselves when often it is the ranchers who have encroached the natural habitat of the wolves. The ruthless killing of these majestic, smart, and kind creatures is not fair to this important species. Thank you for considering my comments.

Hello, As a Washington state resident I strongly value our wildlife and wild lands. I have been so pleased to see the re-population of wolves in our state and so hopeful that the ecological balance that has been lost for so many years could finally be restored with the reintroduction of these top predators. That is why it is so important to me that we continue to focus on ways to protect the wolves that have returned and are living in our state, and to continue working hard and resolving the wolf and human conflicts that arise. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Once I saw a wolf while backpacking. It looked so proud and free. We need wolves to establish balance in the wilds. Thank you for considering my comments.

Sincerely,

Marcia Marcia
Viroqua, WI 54665

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies.

Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators. An apex predator has an important job of keeping the rest of the food chain in balance so no herbivore numbers get out of control; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. There needs to be an effort to co exist between wolves and livestock. Killing the wolves is not the answer. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Kathy Kathy
Athol, MA 1331

Washington Department of Fish and Wildlife

Thank you for reading and hopefully listening to my words. Our wolves are our treasure and an important role to our ecosystem. I truly believe that humans interference is costing our wildlife grave danger. We must change. We must change to benefit our future and a future without wolves will cause suffrage to our lands. It is not up to us to alter it so it fits a specific agenda.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

I often wonder why people are so terrified of wolves, which have been part of the balance of nature since long before humans came along. One would think the State of Washington is quaking in its boots over a relative few wolves, and that the State would rather see the extinction of wolves in Washington---and maybe the world----than allow a pitiful number of wolves to exist. Do all employees of the Washington Department of Fish and Wildlife sleep with guns under their beds and open-carry firearms almost everywhere out of mortal fear of this keystone species? Watch that bush in the parking lot! Could be a wolf there! Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Kristine Kristine
Grosse Pointe, MI 48230

Washington Department of Fish and Wildlife

I am writing today to suggest that the creation of a “post-recovery” plan for wolves at this time is premature. This is because Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments. Our children and grandchildren should grow up to know a world where wolves are alive and well. These animals contribute to the health and diversity of our environment.

Sincerely,

Richard Richard
Oakland, CA 94611

Washington Department of Fish and Wildlife

OMG! Why does the state of Washington have it in for wolves?! Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Laura Laura

Washington Department of Fish and Wildlife

The evidence fails to support the argument that killing predators protects livestock. And surely removing this top predator does not fail to damage its natural ecosystem. Thus, there is no arguable benefit to killing wolves, solely reasons to protect them. So let's see some real recovery for starters. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Janis Janis

Washington Department of Fish and Wildlife

Wolves still need help and support to once again fill their important role in healthy, functioning ecosystems in Washington. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Elizabeth Elizabeth

Washington Department of Fish and Wildlife

Wolves have short, hard lives. Don't make it worse for them by attacking their families, when they help keep the wilderness running smoothly and non-native cows ruin the grassland. (Cows originated in India and Europe) Ranchers should keep dogs and donkeys for protection, stay out of wolf habitat and keep their cows behind fences and in barns at night. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. I am a life-long westerner who grew up in a ranching community - and who in fact welcomes wolf recovery in the Western states where they were exterminated decades ago. I know better than to blame the livestock industry's modern business difficulties on the wolf population - and as proven keystone species, wolves play a much more important role in the long-term health of the larger western ecosystem than livestock production. Please stop wasting valuable time and resources dithering about future wolf management - which frankly seems just another tactic to avoid dealing in an open way with the issues of critical wolf recovery and conservation NOW. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Washington Department of Fish and Wildlife

I am vehemently opposed to removing endangered species protection from WA wolves, period. This is especially the case in our beautiful state of Washington where a handful of brave wolves have made their way back to re-establish themselves after decades of mass slaughter. How many is that? Oh, maybe 120 individuals? 120.

This is a good start to developing a healthy gene pool. What happens when we eradicate wolves and other large predators? Biodiversity fails and systems collapse creating imbalances in other species that must then be managed (killed). Please, let's use science to understand how to live with nature rather than failing at our attempts to control it. Please use science and fact to build WA plans to balance nature's needs with business needs.

Much of the land where wolves reside is public land, our land. Wolves should never be killed on public land. I am aware there has been wolf conflict with unfortunate cattle that have been knowingly put in harm's way on public land. This is sad for everyone: It seems cattle have been domesticated to the point of losing their instinctual survival skills. They are knowingly pastured where wolves are knowingly trying to re-establish themselves. No one is happy with how this turns out.

Please develop a plan that removes cattle from public land and that provides for non-lethal means to mitigate predation loss, should it occur. This can't be that hard.

Lastly, let's get back to science, facts to drive our decision making. We need our wolves and apex predators to recultivate our healthy biosystems. Their populations must stabilize to maintain that health. We know this. Yellowstone is a perfect example. Thus, I say, wolves should never be hunted out of anger or for fun or trophies or contests. Please develop laws that protects them from this.

America rightfully prides itself on its natural landscape and wildlife. Biodiversity is pivotal to restoring and preserving these assets. Please, let's try to protect and live in harmony with all creatures great and small. Wolves are the Wild.

Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Janice Janice
Seattle, WA 98109

Washington Department of Fish and Wildlife

In the U.S., taxpayers have paid hundreds of thousands of dollars to support recovery of healthy sustainable wolf populations. We want an ecologically sound return on our investment. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan for wolf recovery.. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Hannah Hannah
Ogden, UT 84401

Washington Department of Fish and Wildlife

I am a biologist, biology instructor, and long-time resident of Washington State, having lived both in Eastern Washington and West of the Cascades. I have the following comments about this plan: ? The science of the plan must be updated; the current plan does not reflect more recent studies of wolf behavior, wolf recovery, or the most effective methods of avoiding wolf-livestock conflict. ? This plan should NOT be based on "social consensus" of a small number of participants in the process (a number reduced by the department's cancellation of all public hearings in favor of just 3 webinars). Any wildlife management plan should be driven by science, by experts, and by broad opportunities for public input. It must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. ? Studies of wolf-livestock conflict consistently show that non-lethal means are MORE effective than killing wolves. The new plan must prioritize non-lethal means for management of this issue. ? Lethal means of managing wolves (such as the destruction in Washington of four wolf packs by the department) has been shown to decrease the public's tolerance for the presence of wolves in our ecosystems, likely because lethal management conveys the message that wolves are harmful rather than beneficial. ? Wolves should NOT be killed on public lands, whose ecological resources--including wildlife--are held in trust for ALL. Public lands should NOT be treated as "private reserves" for livestock operations. ? Wolves should not be designated nor managed as "game." Trophy collection, trapping, and hunting should be forbidden in the new plan. ? A management plan for wolves should be implemented by the department's endangered species staff, not by the Game Management Division. ? Growth of the wolf population in Washington State was stagnant in 2013, 2017, and 2018. This indicates that a plan for "post delisting" is pre-mature, particularly since there are NO wolf packs in one of the state's "recovery zones." ? This plan should include steps for educating the Washington State public about wolves, including their beneficial effects they have on ecosystems.

Therefore I join with the Center for Biodiversity in urging you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Melinda Melinda

Washington Department of Fish and Wildlife

I am writing as a public health advocate who strongly supports full protection for our endangered wildlife that includes wolves. Please be aware that creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs which includes wolf recovery and conservation. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, all current wolf plans and any future wolf plan, must include management guidance, policies and protocols. These policies and management must very carefully evaluate any policy that could result in wolves being killed. All policies and protocols must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments and recommendations as you formulate all plans for state delisting of wolves in Washington state.. Sincerely, Jean Marie Naples, MD-Ph.D.

Sincerely,

Jean Jean
Suffern, NY 10901

Washington Department of Fish and Wildlife

quit subsidizing the degradation of our forests by allowing cattle ranchers to damage our ecosystems and promote weeds, erosion, and native plant destruction! Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Bay Bay
Bellingham, WA 98227

Washington Department of Fish and Wildlife

Every year Americans spend millions on their pet dogs. Yet there remains a disconnect with how we perceive the ancestors of our beloved pets. Without wolves (and their intelligence and social nature) we never would have been able to experience the bonds we form with "Man's Best Friend." Wolves are a critical part of the food chain as an apex predator, who can keep prey populations strong and healthy but eliminating the weak and the sick from herds. How can we stand by and allow them to be slaughtered? They aren't that much different than our pet dogs!! WE NEED TO SAVE THEM Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Washington Department of Fish and Wildlife

Washington is far from meeting the goals for wolf recovery set forth in the current plan, so creating a “post-recovery” plan would be premature. Instead, the Washington Department of Fish and Wildlife should focus on current wolf-management needs. These include: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators like wolves; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Wendy Wendy
Toledo, OR 97391

Washington Department of Fish and Wildlife

We need to save the wolves.

Creating a “post-recovery” plan for wolves is premature since Washington is far from meeting the goals set forth in the current plan. The Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, without killing, conflicts between livestock and wolves. These conflicts often take place in some of the state's best habitat for wolves (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. Please help educate the public! Especially those calling for the euthanization of wolves.

The current wolf plan and any future wolf plan, management guidance, policies and protocols (and especially those which could result in wolves being killed) must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators.

(3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Hannah Hannah
Leavenworth, WA 98826

Washington Department of Fish and Wildlife

WDFW Director Susewind, WDFW Commission, and Governor Jay Inslee: No recovery plan for wolves in Washington State can reasonably include the killing of wolves because of cattle depredation. The cattle that are on 'Cattle Grazing Allotments' do not have the priority of existence over the wolves. Yes, the federal government has legal reasons for making the claim the cattle do have the priority, but a reasonable person understands that legal stance to be inconsistent with our ecosystem realities. The cattle are an invasive species and are harmful to the local environments, and to the global ecosystem. The support industry of destructive agriculture to provide feed for cattle is having dire and alarming consequences globally. Cattle ranching is beginning its economic death throws now because of its destructiveness and its inefficiencies in providing viable nutrition to a hungry global populace. Next week is the premiere of the movie Game Changers. I highly recommend you watch it and take to heart its message. It is your purview to be responsible stewards of our State's environments, wildlife, economy, and climate crisis agendas. Wolves are an apex factor in all of this, not just an apex predator. They are the guardians of the wilderness and are the guardians of our ecological consciences. To disregard the preeminence of wolves as a major and critical influence in the paradigm of ecological responsibility is folly. It may be currently politically expedient for you to demonize and kill wolves, to callously disregard them as the essential element in our biological diversity, but to do so is to further the demise of our State's place in the global ecological crisis. signed: James V. Loran Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Sincerely,

Eileene Eileene
Sherwood, OR 97140

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf management needs. These factors include: (1) Resolving through nonlethal means the conflicts between livestock and wolves, which occur in some of the state's best wolf habitat; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. Ignorance and misplaced fear regarding wolves are rampant, and the people who understand wolf biology least are unlikely to “achieve enlightenment” on their own.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing. This is not how science works. It's all fact-based, the whole picture, not a partisan process; (2) Answer the global call by scientists to protect and conserve apex predators because they are the largest influence on their entire environment; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. As a veterinarian and someone who has studied wolves for 4 decades, I know we must do better and can do better in balancing the needs of predators with the needs of ranchers. My family has a rural flock of 40+ chickens in an area with plenty of coyotes, raccoons, mink, and raptors. I know what it is to coexist with the native wildlife where I live. There is no reason why wolves need to bear an unwarranted stigma that is causing their extinction instead of restoring them to most of their historic habitats.

Thank you for considering my comments.

Sincerely,

Mary Mary
Zionsville, IN 46077

Washington Department of Fish and Wildlife

Our wolves are not being properly protected. Use of non lethal methods which includes Range Riders is not being used as it should be. Continually catering to one rancher is not a good message to send to all our states residents. Allowing fearmongering perpetuates hate and keeps dissention ongoing. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Pam Pam
Bainbridge Island, WA 98110

Washington Department of Fish and Wildlife

Wolves are ecologically indispensable. The science demonstrates that their absence causes a harmful cascading effect on many other species.

As such, wolf management should respect the science and maintain healthy wolf populations. Management should focus on human attitudes and practices. Proper husbandry can greatly reduce conflicts and non-lethal measures used when necessary. However, a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Richard Richard

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments. I trust that you will be guided by a decision making process that seeks to preserve wolves as part of a delicate and complex ecological web. The wolves were in Washington before us. They need our collective help to remain here.

Sincerely,

Lauren Lauren
Seattle, WA 98177

Washington Department of Fish and Wildlife

Our poor, poor planet is much too close to her tipping point for us to be enacting policies that will only serve to push her over the edge. We need to preserve what precious little pristine wilderness remaining and re-wild much of that stolen from the animal nations. We must ditch lethal forms of wolf "management" in favor of science-based, peaceful co-existence/compassionate conservation strategies.

Sincerely,

Debbie Debbie

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. (4) Raising livestock for meat is one of the chief contributors to global warming. Ranchers should not have priority over keeping western ecosystems healthy by allowing natural predators to keep populations of prey species in check, thus allowing endangered plant species to thrive and reducing erosion along rivers and streams. Thank you for considering my comments.

Sincerely,

Laurel Laurel

Washington Department of Fish and Wildlife

It breaks my heart to watch so-called expert wildlife managers support one type of special interest group over protecting natural, healthy ecological processes and over the majority of citizens who want fair, even-handed management for God's creatures. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife needs to focus its attention on addressing current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in democratic, transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

It is hard to understand why, in 2019, our society is still blaming wolves for being what they are meant to be, an apex predator. There is so much to admire in the social and family lives of wolves and their intelligence and cooperation with each other, I cannot understand the desire of so many human beings to exterminate them. For example, creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Janice Janice
Hadley, MA 1035

Washington Department of Fish and Wildlife

Dear decision -maker I am contacting you to urge you to Protect Washingtons Wolves. Wolves have not yet recovered so Wolves should not be Delisted, more wolf management must be available for conflicts with wildlife and we must be only using non lethal deterrents with conflicts with livestock. Science must also be used and the Public should have more say when conflict or conflicts occur, it is not right the rancher is only person who has A say with the Publics wildlife. Washington must focus on more wolf management needs along with education on wolves and wolf /livestock conflicts(non lethal methods) Killing is not an answer Thank you for considering my comments Sincerely Ms Connie Burris 2125 Catalina Lane Springfield, Illinois 62702 puggygirl13@yahoo.com

Washington Department of Fish and Wildlife

It is premature to create a post-recovery plan for wolves in Washington when the recovery goals from that plan have not yet been met. Rather than de-listing wolves, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs, including: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. I therefore ask that you: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Redmond, WA 98052

Washington Department of Fish and Wildlife

I am submitting comments because I have loved wolves all my life and am also aware of the significant role they play in creating healthy ecosystems (e.g. the positive changes that occurred to Yellowstone after the reintroduction of wolves). I live in California and I testified in several of the hearings that lead to wolves being listed on the California Endangered Species. I have also been active in opposing the Trump administration's attack on wolves and its misguided attempt to gut the federal Endangered Species Act. Because I have been following this issue for a long time, I am well aware that attempts to keep wolves from being listed or to remove their endangered species protections frequently come from members of the livestock industry, or from people who fear wolves, but know nothing about them, or from trophy hunters. With regard to livestock, as both Project Coyote and Defenders of Wildlife have demonstrated, there are effective non-lethal means of protecting livestock from wolves and other predators so there is no practical or ethical justification for making it easy for the livestock industry to kill wolves. With regard to ignorance, people can be educated. With regard to trophy hunting, it is an ethical outrage and should be banned.

It is good news that the number of wolves in Washington State is increasing, but the total number of wolves is still very small for a state the size of Washington and there is room for wolf populations to expand. Washington is far from meeting the wolf population goals set forth in its current plan so creating a "post-recovery" plan for wolves at this time is premature. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving conflicts between livestock and wolves by non-lethal means. This is something that is already taking place in some of the state's best habitat for wolves and these efforts should be expanded. There is no justification for Washington state to prematurely delist wolves and allow their killing when successful non-lethal means are available. The state needs to seek a win-win situation where livestock are protected and wolf populations can thrive. (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. It is unacceptable to ignore this important means of promoting coexistence.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing. Doing so is a deliberate misuse of scientific data. that will not only lead to unjustified delisting and death, but also lead to public distrust of your agency.

(2) Answer the global call by scientists to protect and conserve apex predators; (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving; and (4) The planet is currently facing collapsing ecosystems and an extinction crisis. Your agency should be doing everything in its power to avert this crisis and that means working to support healthy wolf populations and the ecosystems that depend on them, not prematurely depriving wolves of endangered species status. Thank you for considering my comments.

Sincerely,

Karen Karen

Wolves in the lower 48 states are far from recovered. Oppose delisting wolves instead of focusing on what happens when they're extinct. Washington has a lot of wilderness, much of it contiguous with wolf habitat in Canada, and can be a vital leader in wolf recovery. Research in Yellowstone has shown that wolf recovery is accompanied by almost miraculous ecosystem recovery.

Be a leader and not an enemy of caring for our shared home planet. *** Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Michael Michael
Boynton Beach, FL 33426

Washington Department of Fish and Wildlife

Stop coddling a small number of ranchers. Washingtonians want wolves. Keep cows off public property. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Liz Liz

Washington Department of Fish and Wildlife

I strongly believe creating a “post-recovery” plan for wolves is premature since Washington hasn't met the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife should focus its attention on current wolf-management needs which include: (1) Resolving, by nonlethal means, the conflicts between livestock and wolves currently taking place in some of the state's best habitat for wolves. (2) Conducting extensive public education on the importance of wolves. Although, this is emphasized in the current plan, it has not been done by your dep't despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plans, management guidance, policies and protocols, especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and stop messaging that livestock has more value than wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Sharen Sharen
Lillian, AL 36549

Washington Department of Fish and Wildlife

Over 55 years ago my grandfather taught me the way in which he dealt with non lethal approach to wolves in Eastern Washington. He was a farmer and rancher in the Palouse. How wise he was, not killing for a natural balance in his world. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Joe Joe
Desert Hot Springs, CA 92240

Washington Department of Fish and Wildlife

Increasingly, studies support to role of predators in healthy ecosystems. Wolves in Washington are part of healthy ecosystems throughout our state. To that end, I implore you to develop a new wolf plan that supports pack development and sustenance, de-conflicts current land use with ungulate herds, and improves public understanding of wolves. At this time, creating a “post-recovery” plan for wolves is too early. We’ve even lost packs in our state under the current plan. Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: 1. As one of the most contentious issues, the Department needs to resolve—through nonlethal means—conflicts between livestock and wolves. Particularly since these are taking place in some of the state's best habitat for wolves; and 2. Improve Washingtonians understanding of wolves by conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

3. Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: a) Conduct a full SEPA analysis to develop wolf-livestock protocols based on science, public input and rule-making. Stop cherry-picking science to justify wolf-killing; b) Answer the global call by scientists to protect and conserve apex predators. Stop state-sanctioned hunting or trapping of wolves or designation of wolves as game mammals; and c) Predators are part of the healthy ecosystem equation. Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Cynthia Cynthia
Tacoma, WA 98422

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) All over the world, and in the US, nature is tremendously unbalanced.

The northeast is overrun by deer. So we need better land use planning, better use of existing resources and we need to answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Kathi Kathi
Pittstown, NJ 8867

Washington Department of Fish and Wildlife

As a wildlife watcher and citizen scientist, I am distressed by the approach you've taken toward wolves in Washington.

Your plans do not acknowledge the value that wolves provide, such as helping ecosystems thrive by limiting growth of deer and other species that overgraze, cause millions in costs from car accidents, and suffer from chronic wasting disease (CWD). Please consider how much wolf tourism and wolf conservation could mean to your state finances.

As the Dept of Fish and Wildlife, your job is to take -- and present to the public -- a scientific approach. Why not be a leader in showing the value and benefits of coexisting with wolves to the public? Thank you for giving me the chance to provide comments.

Sincerely,

Kathleen Kathleen
Indianapolis, IN 46250

Washington Department of Fish and Wildlife

If we rush to legalize killing wolves we will soon return their population to the category of near extinction. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Eileen Eileen
Port Townsend, WA 98368

Washington Department of Fish and Wildlife

Can you see how it is premature to create a “post-recovery” plan for wolves at this time? Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, I respectfully urge the Washington Department of Fish and Wildlife to shift its focus and attention on current wolf-management needs.

This includes: 1. Resolving — through nonlethal means — conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and 2. Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you. All wolf experts say public education is the single most important action to take for successful wolf conservation.

The current wolf plan and any future wolf plan, management guidance, policies and protocols — plus those which could result in wolves being killed — should be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore, I respectfully urge you to: 1. Stop the dangerous practice of picking apart science — which is then used out of context — to justify wolf-killing; 2. Answer the global call by scientists to protect and conserve apex predators; 3. End current messaging and language that prioritizes livestock over wolves; and 4. Use every opportunity to extol the value of top predators in keeping nature healthy. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you in advance for your ethical response to this important matter.

Sincerely,

K K

Irvington, NY 10533

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Elizabeth Elizabeth
Culver City, CA 90230

Washington Department of Fish and Wildlife

I live in Oregon now, but have been a Washington native for over 50+ years, 30 of it over in NE WA, where I was born & raised. With that being said, if McIrvine doesn't want range riders, and refuses to use deterrents, then it's his loss, and should "not" be compensated by the state. It's bad enough the WDFW are doing the wolf killing for this rancher. The public needs to be educated (especially NE Wa residents) on how the wolf as a predator can help us with CWD, sooner or later it will hit there. Education, coexistence is essential. Either that or put in the WDFW budget to relocate some packs to the westside of the state. Although I can guarantee that if you pose education & coexistence with ranchers you will get negative feedback from these people. They are ignorant & set in their "old wild west mentality" and that needs to end! Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Rose Rose
Rockaway Beach, OR 97136

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Wolves, and predators in general, play vital roles in the healthy functioning of ecosystems. There are ways for humans and wolves to coexist, and I urge you to enact the points above to help us do so. Please make sure that these wolves not only recover, but can then continue to have a healthy and stable population, so that all of us can share in the benefits of having them around.

Thank you for considering my comments.

Sincerely,

Katie Katie

Washington Department of Fish and Wildlife

Wolves have a valid place in the ecosystem. This should be encouraged rather than trying to eliminate them to benefit grazing permit holders. The State has no obligation to protect grazers. The permit holder needs to decide if it makes economic sense to put grazers in good wolf territory. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Our livestock should not take priority over the land we stole from the native americans and are now mutilating. This culling of wolves is a disgrace. Killing one member of a food chain damages the entire chain, and we already have an abundance of prey species that no longer have predators to control them. If you continue to destroy our planet and our country, I will face the consequences, my children will face the consequences. Unbelievable. Thank you, i guess, for considering my comments.

Sincerely,

Isabella Isabella

There are plenty of studies that show that wolves are a needed component for healthy wild ecosystems. We must find a way to balance the needs of ranchers (who seem to think that public lands are free grazing lands) and the needs of the rest of the state's wildlife. I urge you to take steps to ensure that wolves continue to get an opportunity to grow and thrive in our state. Thank you! Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Erich Erich
Redmond, WA 98052

Washington Department of Fish and Wildlife

Regarding the wolf killing in Ferry County: You are killing an endangered species that belongs to all citizens of this country to save a few common cows that belong to just one person. By killing experienced adult members of a pack, you are leaving juveniles who haven't learned to hunt efficiently and are forced to target easy prey, namely livestock. The affected rancher should not be grazing his cattle in prime wolf habitat.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Washington Department of Fish and Wildlife

The wolves of Washington have not met the recovery goals the state wolf management plan defined. Given this, the focus needs to be on recovering the wolf population to the stated goals, not in creating a “post-recovery” plan. Working on such a plan is clearly inappropriate at this stage. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. This has to change. As promising as this plan appears to be, much more can be done. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Like all other animals, wolves play an important part in the eco-system and therefore should be respected and protected. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Robert Robert
Novato, CA 94945

Washington Department of Fish and Wildlife

Wolves are an essential part of the ecological food-chain, and creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Washington Department of Fish and Wildlife

Wolves are so crucial to balancing our ecosystem. They've barely scratched the surface of recovery and yet the West continues to relentlessly persecute this species. Wolves are an important part of the natural world and deserve to be protected, not prosecuted.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Washington Department of Fish and Wildlife

As you work to create a “post-recovery” plan for wolves, it should include: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves and forest ecology.

Additionally, please don't kill the wolves we have. Conserve these apex predators.. Thank you for considering my comments.

Sincerely,

Michael Michael

Isabelle Isabelle
Seattle, WA 98144

Washington Department of Fish and Wildlife

Washington's wolves are under constant attack and threat from humans who insist on running cattle on our public wild lands. We must protect wolves and get cattle off wolf breeding grounds. Wolves belong on our wild lands and help create a healthy and biologically diverse environment. All other animal and plant species thrive when apex predator/wolves are in our environment. Wolves keep deer and elk populations much healthier too. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Reno Reno
Marana, AZ 85653

Washington Department of Fish and Wildlife

Washington is far from meeting the goals set forth in the current plan. Wolves are a typing point species. An entire eco-systems health depends on them. Look at what adding them to the Yellowstone environment did. The Washington Department of Fish and Wildlife must focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you. All wolf experts say public education is the single most important action to take for successful wolf conservation.

A real effective plan must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. To do that you must Stop cherry-picking science to justify wolf-killing; Conserve apex predators to save an entire eco-system. Bio diversity must be a priority! Stop messaging that prioritizes livestock over wolves. We need to stop eating so much meat. All science now emphasizes this point.

Thank you

Sincerely,

teah teah
San Francisco, CA 94102

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. This action is obviously not about species protection, but political goals. This is not in the best interest of the species or the ecosystems which are structured around keystone species such as the wolf. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Problems with human conflict are generally due to human ignorance and prejudices. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Please take this one step at a time: 1. Support wolf recovery until Wolves Have Recovered. 2. Then proceed with your "post-protections" wolf plan. Thank you for considering my comments.

Sincerely,

Deborah Deborah
Ashland, VA 23005

Washington Department of Fish and Wildlife

Stop the vicious assault on one of the most important animals in many food chains. The selfishness of humans to want these beautiful majestic animals banished is pure selfishness from hunters, ranchers, and special interest groups. We the public want to see these iconic animals live their lives in peace and do what they were meant to do with their 'families' as part of the food chain. People can live in harmony with wild animals, if they will stop thinking just about themselves and realize these animals were put here as natural predators for an important reason. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Wolves are vital to our environment. It has been proven that things work better with wolves in our environment. Thank you for considering my proven comments.

Sincerely,

Sandra Sandra
Huntingdon, PA 16652

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. To keep our environment healthy, all animals need to be a part of it, including wolves. Thank you for considering my comments.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. I'm someone who has always read what happens when people kill too many of the apex predators like wolves. It has devastating consequences for the web of life and other species on down to plant life. WE know that deer get overabundant and trees are decimated . There's a lot of evidence now that they have . a correlation with beavers and HEalthy ponds and those habitats we have been in great shortage of and need to bring back for our pollinators! All the animals' health directly relates to creating a healthy envirONment for humans as well!! Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Washington Department of Fish and Wildlife

Wolves are incredibly important in providing healthy ecosystems we need now more than ever. If wolves are allowed to sustain their numbers in the pack they're much less likely to come near human activity. There's so many alternatives for discouraging wolves from livestock as well. Killing them only creates more livestock encounters as the remaining wolves don't have the resources to hunt wild animals. Contrary to hunters that take the biggest animals, wolves take the weaker and sick ones leaving the stronger gene pool to procreate. Please adopt a non-lethal approach to wolf management. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

Hi: A “post-recovery” plan for wolves, at this time, is premature. Washington is still far from meeting the goals set forth in the current plan. How about focusing on current wolf-management needs, including: = Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves. = Conducting extensive public education on wolves. While in the current plan, it has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. Any future wolf plan must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Please stop justifying the killing of wolves.

Recognize and teach the value of top predators keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Thank you. Dr. Demian

Sincerely,

Dr. Dr.
Seattle, WA 98146

Washington Department of Fish and Wildlife

Let's work to defend our wild places and our wild neighbors. Thank you for considering my comments.

Sincerely,

Bobby Bobby
Frankfort, MI 49635

Washington Department of Fish and Wildlife

I have an affinity to wolves, and greatly admire their species not simply for their necessary and rightful PLACE in ecosystems, but for their strongest personality trait - their capacity for making emotional attachments to other individuals, not just within their own families, but with other species, such as humans and dogs. Wolves also possess a basic aversion to fighting and only situationally resort to it. Dr. Gordon C. Haber, a noted wolf biologist in Alaska's Denali National Park and Preserve, has said that if you imagine the most unusually intelligent, emotional, and sensitive dog you have ever known, that's how ALL wolves are, and their extraordinariness is *commonplace* among them. With such a plethora of desirable traits (ones we humans don't often enough demonstrate ourselves!), we absolutely need to focus on critical wolf recovery, followed by their future preservation.

Creating a "post-recovery" plan for wolves at this time is premature and a waste of valuable time and resources, since Washington is still far from meeting the goals set forth in the CURRENT plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs for wolves, as what they immediately need NOW. This includes: (1) Resolving, through NON-lethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting *extensive* public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is THE single most important action to take for successful wolf preservation. Those old and utterly erroneous myths about wolves, merely made up by humans, must be replaced by the true FACTS AND SCIENTIFIC OBSERVATIONS about them.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a *science-based,* public rule-making process that results in totally transparent, rational and enforceable strategies. Therefore I encourage you to: (1) Stop cherry-picking science to attempt to justify wolf-killing! (2) Answer the global call by scientists to protect and conserve vital apex predators. AND, (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes the livestock industry, over wolves. Too many of the public won't see any, or enough, reason to coexist with wolves if the department itself fails in choosing to explain that wolves are ecologically important and absolutely worth preserving. Thank you for considering my comments.

Sincerely,

D. D.

Leslie Leslie
Torrance, CA 90501

Washington Department of Fish and Wildlife

It is far too early to create a “post-recovery” plan for wolves at this time. Washington has not yet met the goals set forth in the current plan. Instead of racing to create a post de-listing plan, the Washington Department of Fish and Wildlife must instead focus attention on current wolf- needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you in advance for considering my comments.

Sincerely,

Donna J. Donna J.
Olympia, WA 98502

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Come on Washington and Governor Inslee and the WA Dept. of Fish and Wildlife, you are better than this. Protect these wolves and educate the public as to why! It's in your lap now.

Thank you for considering my comments.

Sincerely,

Joan Joan
Estacada, OR 97023

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. In other words, maintaining and protecting the place for wolves is needed to preserve any semblance of balance and stability in the overall wildlife population. Do not sacrifice that for unneeded cattle operations! Thank you for considering my comments.

Sincerely,

Clayton Clayton
Wilmington, DE 19810

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan! Washington's endangered wolves are nowhere near the recovery goals established in the state's wolf-management plan! Yet, state wildlife officials are already working on a plan for after the wolves have been stripped of their state endangered species protection! The state has invited the public to make suggestions about what should be in this plan! Let USs remind it what our protected wolves really need: conflict resolution that doesn't depend on killing them — and a public-awareness campaign that supports their recovery.

Instead of racing to create a post-de-listing plan, the "Washington Department of Fish and Wildlife" must instead focus its attention on current wolf-management needs! This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

DIANE DIANE
Wheaton, IL 60189

Washington Department of Fish and Wildlife

It's quite frankly a joke that you are asking the public to weigh in on "post-recovery" wolf plans while you continue to gun them down. Your department really needs to focus on how to manage wolf populations without killing them.

Having watched many a documentary on these incredible predators I've seen multiple effective ways at keeping predation on ranch livestock at a minimum and the ranchers in these documentaries have claimed them to be effective. So why do you grab your guns any time there is a conflict? It's lazy, short sighted, contrary to what the public wants and it completely ignores decades of science on how to manage this problem. The question I have is, who do you belong to? The majority of the voting and tax paying public that pays for your salaries and allows for your job? Or the interests of a few wealthy and politically connected individuals? In a true democracy you belong to me, Joe Public! Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Washington Department of Fish and Wildlife

Washington is far from meeting the goals set forth in the current wolf recovery plan, so the idea of a post-recovery plan is premature at best and disingenuous at worst. Instead of wasting precious time creating a post-delisting plan, the Washington Department of Fish and Wildlife should instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This need is emphasized in the current plan yet has not been done, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators which are vital to healthy ecosystems; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Stephanie Stephanie

Washington Department of Fish and Wildlife

As an environmental and wildlife activist for many decades, when allies and I read about any public agency's rush to kill apex predators (in two or three states) when their populations' recoveries are not solid, it follows that any "post-recovery" plan for wolves at this time is not only borderline premature, it also suggests a rush to ensure they will never fully recover. Washington has not even met objectives in the current plan, which is where the focus should be--instead of "post-recovery."

We urge the Washington Department of Fish and Wildlife to focus only on current wolf-management needs, such as: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been implemented, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Additionally, we urge the WDFW to: (1) Stop cherry-picking science to justify wolf-killing, which demeans an otherwise respected agency; and (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving (which hopefully is not the agency's clandestine unspoken goal). Thank you for considering our views.

Sincerely,

Marilyn Marilyn
Loomis, CA 95650

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. After these goals are met, please consider providing for them the same protections that animals listed as endangered species. Wolves have been demonized, unfairly, and in reality are an essential part of a healthy, balanced ecosystem. Please treat them with the respect and protections they deserve. Thank you for considering my comments.

Sincerely,

Stefanie Stefanie

Sincerely,

Matthew Matthew
Cambridge, MA 2139

Washington Department of Fish and Wildlife

I have been extremely disappointed in DF&W's approach to wolf management this summer. Killing wolves on public land to protect livestock should not be happening. This has happened repeatedly in the same area. It is clear that that area is prime wolf territory and for wolves to succeed in WA they need to be allowed to exist there. It's time to either get cattle out of there or require the rancher to accept that DF&W will not be killing wolves on public land. Let the rancher assume responsibility for grazing on public land. It is a tragedy that so many wolves have been killed for one rancher. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. I am a physician in Washington state and can speak first-hand to the health benefit of wild places, wildlife, and healthy ecosystems. The allure of the Pacific Northwest is based on these concepts and should be foremost in our minds. Our identity, our economic well-being, and our health all depend on it. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Jane Jane
Seattle, WA 98105

Washington Department of Fish and Wildlife

Please understand that creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I strongly urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Robin Robin
Rancho Palos Verdes, CA 90275

Washington Department of Fish and Wildlife

Wolves are important for biological diversity and wildlife balance--they continue to require protection. Public education is needed--many people think of wolves as depicted in fairy tales as being the "Big Bad Wolf" which is not accurate. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Stop catering to ranchers who continue to put their cattle at risk. They need to manage their grazing areas better. Wolves belong in the ecosystem, cows are the intruders.

Sincerely,

Sue Sue
Carbonado, WA 98323

Washington Department of Fish and Wildlife

I am completely disgusted with your pandering to cattle ranchers who take no responsibility for using PUBLIC LAND and take no responsibility for protecting their own cattle. Killing these wolves to insure HE can make money is a horror that is not lost on the rest of us. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. As former, long-time residents of Washington state, we find the current 'management' approach of killing and relocating wolves absurd. Just as people do not wish to be forcibly relocated, neither does wildlife. For the state's ranchers to absolve themselves of any responsibility toward protecting their livestock speaks volumes as to what they unreasonably expect from the state and its taxpayers. Where are the ranchers' best efforts to coexist with wildlife? Mass slaughter of any wildlife species only triggers a new reproduction cycle to fill the vacuum with immature juveniles who behave much as human juvenile delinquents do when they are missing a family structure. We will end up with MORE not fewer wolves. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

YOU SPINELESS COWARDS!!! Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. YOU SHOULD BE WORKING TO PROTECT THE WOLVES INSTEAD OF PLOTTING TO DE-LIST THEM AFTER THEY RECOVER! Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Stefan Stefan
Bradenton, FL 34203

Washington Department of Fish and Wildlife

Wolves are my favorite animal and I'd hate to see them disappear. Please consider the following. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Amanda Amanda

Washington Department of Fish and Wildlife

I am a Washington resident that has been proud in the past of Washington being a leader. Lately Washington's Fish and Wildlife department has not been working in the best interest of Washington residents in several cases. The treatment of wolves is the latest. I believe public lands should be for wildlife first and not for the interest of ranches first. Grazing on these lands has been shown to damage them in multiple ways. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Americans like me appreciate the existence and continued survival and thriving of our wolf population. They were here first and deserve to stay on our lands. Farmers and ranchers knew wolves were part of the equation from the moment they began farming and ranching. Protecting livestock does not mean killing natural predators. Humans cannot merely kill what stands in the way of what they want. Canine shepherds can help, but losses may still occur. It is part of the business. It does not justify the extermination of our wolf population. Thank you for considering my comments.

Sincerely,

Joan Joan

Washington Department of Fish and Wildlife

Attn: Washington Department of Fish and Wildlife Hello, Thank you for inviting the public to make suggestions and to comment on the current wolf post-recovery planning. I care deeply about our environment and the animals in our state and beyond. I believe we have a responsibility as humans to be stewards of the land and to be fair in managing challenges while protecting the environment and endangered species. I am very concerned that wolves in Washington are not being given the fair opportunity to recover and find their place in our eco-system. After researching the history of wolf recovery in Washington and some of the issues and handling of issues in recent years, I have to say I am disappointed and concerned.

I do not feel that the killing of our wolves with their current population level is responsible or fair or a good solution to the conflicts that have occurred. I would ask WDFW to focus forward on non-lethal solutions, and that more should be looked at regarding farmers responsibilities to reinforce their properties and deter wolves, so wolves may go elsewhere to find more appropriate prey in the wild. I would also like to see more funds and efforts go toward research and current science, public education and outreach, and finding non-lethal solutions for conflicts. I believe wolves in Washington need and deserve to be protected and advocated for. It is my understanding we have not yet met goals in the current plan, and it is premature to even create a 'post-recovery' plan at this time. As a concerned citizen, I ask that your department review how current goals can be met, while looking forward to what more can be done to help wolves in Washington recover and stabilize. Thank you for reading and considering my comments.

Sincerely,

Janelle Janelle
Seattle, WA 98111

Washington Department of Fish and Wildlife

It is premature to be considering a post-recovery plan for wolves when the state of Washington is still far from meeting the goals that would indicate true recovery in the current wolf management plan.

The Washington Department of Fish and Wildlife must focus its attention on current wolf management goals, which include:

- The Department must resolve conflicts between livestock and wolves using nonlethal methods. Currently wolf conflicts are occurring in some of the state's best habitat for wolves, much of which is on our public lands. As a reminder, wolves on public lands must be held in trust for all citizens and should not be killed at the behest of a few ranchers using public lands for grazing. Public-lands grazing is a privilege, not a right. And there are many nonlethal methods that, when applied consistently and correctly, have been proven to be effective in controlling and even eliminating livestock-predator conflicts.
- The Department has an obligation to conduct deep and wide-ranging public education on wolves. While this component is emphasized in the current wolf management plan, WDFW has not put much effort into developing effective and inclusive education outreach on living with wolves. WDFW has failed to connect with the public despite the fact that wolf experts say public education is the SINGLE MOST IMPORTANT action that can be taken for successful wolf conservation.
- Wolf management plans must be developed through a science-based, public rule-making process that is transparent and that results in rational and enforceable management strategies. Under the current plan, management is using lethal control, which is unacceptable, unsustainable and goes against sound, science-based management. The Department's actions have continued to kill wolves despite public outcry. These wolves die to placate a very small number of people who are already taking advantage of our public lands and resources at \$1.35 per cow/calf per month to run their cattle. Not only is that a basement bargain at twice the price, it is not necessary to wipe out entire wolf packs to be able to manage them. Killing multiple wolves living on public lands to prevent livestock loss is not management. It is simply killing wolves.

To be considered a scientifically motivated Department that is respected for being forward-thinking, effective and rational, WDFW must:

- Stop cherry-picking science to justify a political decision. The Department's wolf-killing placates a few ranchers who should be using nonlethal management methods applied in a consistent and correct manner and blatantly are not.

- Get in step with the scientific global call to protect and conserve our apex predators. We are in a mass extinction crisis, stop participating in the crisis and manage wolves through nonlethal methods.
- Develop a public education and outreach program that extols and promotes the value of top predators for keeping ecosystems healthy. And stop sending the message that the state prioritizes livestock over wolves by stopping the Department's wolf killing. The public will only see the value of coexisting with wolves if the Department explains that wolves are ecologically important and worth conserving. The Washington Department of Fish and Wildlife has a responsibility to conserve and protect wolves and all wildlife held in the public trust in perpetuity. And that will only happen if the Department ceases to kill wolves as a blanket solution, begins to talk to the public about coexisting with wolves, and works with livestock operators to use nonlethal solutions that are applied with oversight and guidance in a consistent and correct manner. Please focus on the critical wolf recovery and conservation that still needs to happen. The Department is not yet in 'post-recovery' mode for wolves. There is more work to do. Thank you for your consideration.

Sincerely,

Erin Erin
Sacramento, CA 95818

Washington Department of Fish and Wildlife

As a Washington voter who has followed endangered species issues for many years and the daughter of a scientist and science teacher, I know that creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan, and indeed is slaughtering wolves on a regular basis that could be saved through a better plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say that public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. This responsibility to date has not been fulfilled by your office. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Linda Linda

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. There will always be a group of people who hate wolves and look for every opportunity to kill one. Encouraging coexistence and continued protection of wolves help ensure they have a chance. The protection of our land and wildlife is more important than ever now. Thank you for considering my comments.

Sincerely,

Cindy Cindy
Fenton, MO 63026

Washington Department of Fish and Wildlife

I am very concerned that your agency is in the process of creating a “post-recovery” plan for wolves at this time. At best, this is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan, but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. This inaction on your part is in direct conflict with the current plan's intentions. Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. All species in an ecosystem are a vital part of that system and when one is eliminated it throws the entire system out of balance. Since cattle are not a natural part of the ecosystem they should be better managed and restricted from using public lands to graze. Thank you for considering my comments.

Sincerely,

Shelli Shelli
Boulder Creek, CA 95006

Washington Department of Fish and Wildlife

I like wolves, don't really know why, but I do. Obviously, I want to be assured that wolves will continue to exist in a healthy manner. However, creating a "post-recovery" plan for wolves at this time is premature, Washington is still far from meeting the goals set forth in the current plan. So first, make sure that they have satisfactorily 'recovered'. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sabinsville, PA 16943

Washington Department of Fish and Wildlife

Our wolves need protection. They have not experienced a 'recovery' per the goals of re-population. We are not in 'post-recovery' no matter how we look at it. It's a political statement F&W may want to make....it is not a reality. The murder of specific wolf packs and partial packs, is a heinous reality, an eco-crime and an inhumanity towards wildlife.

We need an entirely new way of seeing wolves....in CO-existence~~ONLY. We need to use only NON-LETHAL and humane methods of conflict resolution. We need to understand the needs of wolves, and of citizens---far beyond a few ranchers and farmers who lack any dignified respect for a keystone species such as this. Our neighbors in Idaho and Montana have opened up wolf season and wholesale slaughter. It's unconscionable. We are not them. Wolves deserve the freedom to exist as much as we do. They deserve a home BEYOND management. Our management of their species is a trail of tears. I am sick-hearted by this complete lack of respect for their intelligence, family life, beauty, and key role as a predator species.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Olympia, WA 98501

Washington Department of Fish and Wildlife

My family is from Washington and we still visit my parents twice a year - one of the reasons we spend so much time (4 weeks each visit) is Washington's natural beauty and wildlife that unfortunately is relegated to the NW. With that said I want to express my dismay at the state's actions against wolves. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of going head-long into a post-delisting plan, the Department of Fish and Wildlife should instead focus its attention on current wolf-management needs, which includes (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore my parents, brothers and I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Elizabeth Elizabeth
Columbia, SC 29206

Washington Department of Fish and Wildlife

Let me be clear, Washington: You DO NOT WANT to lose your wolves. We have, back here in the Northeast. And it isn't pretty. Lyme Disease is soaring -- it is a public health crisis at this point. Overabundant deer are destroying nascent forests and low-lying vegetation and causing dangerous auto crashes, even in under-populated areas like the Adirondacks. There aren't enough hunters to keep up with these numbers. The next-level-down predators, coyotes, are also over-abundant and over-confident. They can be a danger to humans, especially children. It is foolish to thwart nature. Don't do it.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. I know you understand their importance, so it is wrong to keep silent about it. Thank you for considering my comments.

Sincerely,

Cecil Cecil

Carol Carol
San Pablo, CA 94806

Washington Department of Fish and Wildlife

Apex predators and stuff of legend, wolves enchant us with their beauty, intelligence, and complex family structures. Unfortunately, despite their ubiquity on t-shirts, posters, and calendars, wolves in the wild, including Washington State, still require protection.

Washington's wolves have not yet recovered, so the Department of Fish and Wildlife's intention of creating a post-protections plan is premature. Instead, the department should focus on protecting and increasing existing wolf populations while mitigating human-wolf conflicts. The department must find non-lethal means of resolving wolf-livestock conflicts; part of this effort would entail educating the public about ways to co-exist with these predators.

In any case, the department must rely on sound science to create a wolf-management plan. Such a plan would reflect the global consensus in the scientific community to protect and conserve large predators. It would not use poorly supported studies to justify the slaughter of wolves, nor would it prioritize the interests of ranchers over those of entire ecosystems.

Wolves are living symbols of the American wilderness. If we drive these creatures to extinction, we will lose a part of our history and a part of ourselves.

Thank you for your time.

Sincerely,

Dorothy Dorothy
Castleton, VT 5735

Washington Department of Fish and Wildlife

I am a 24 year old scientist, conservationist, and writer, and I love wolves. In addition to my deep personal connection to them (which I'm sure many people share), I also know that they are an integral part, a keystone species, to whatever ecosystems they are found in. We need wolves, too. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Emily Emily
San Francisco, CA 94110

Washington Department of Fish and Wildlife

My name is Myra Scroggs. I have traveled to the West many times to be able to see wolves in the wild. Each ecosystem needs a top predator to maintain the balance of species. Instead of thinking of killing wolves, you should be thinking about how to encourage them. Wolves prey on deer and elk more than anything else and help keep old and diseased or injured animals removed from the prey population. If livestock are killed, there needs to be support for the rancher, but not killing off the wolves.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Myra Myra

Washington Department of Fish and Wildlife

Wolves are a critical and important part of a healthy eco-system. We must protect and conserve them for the well-being of all. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Janet Janet
Chapel Hill, NC 27516

Washington Department of Fish and Wildlife

Much of the joy of living in Washington is getting out there and being part of the little bit of wild that's left in the state. Destroying wolf families is a step backwards. The elk, caribou and deer populations need predators like wolves to keep their populations in balance and prevent the ungulates from destroying riparian areas and other flora.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Wolves are critical to Washington. It's a very complex issue that shouldn't be decided by a handful of angry people. Thank you for considering my comments.

Sincerely,

Hugh Hugh

C C
San Diego, CA 92107

Washington Department of Fish and Wildlife

Don't go getting ahead of yourselves. In case you missed the day they learned about 'order' and 'sequence' in kindergarten, 'post-recovery' comes *after* the actual recovery. You have to meet the goals of your current plan - still a long ways off - before working on, let alone implementing, new ones.

Instead of racing to create a post de-listing plan, the Washington Department of Fish and Wildlife should instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves. Protection of livestock is not a sufficient excuse for killing these magnificent canids. Numerous studies have shown lethal tactics to have little, if not no, effect on depredation rates. There is absolutely no correlation between the number of a given area's wolves killed and cow or sheep lives spared.

(2) Conducting extensive public education on wolves.

People are taught from an early age to fear wolves, even hate them. They are villains in faerie tales: murderers of elder relatives, or bestial servants of witches and fiends. Who could forget the iconic Disney scene where Beast rescued Belle from evisceration at the fangs of a ravening wolf pack? Who doesn't know, instantly, what's meant when they hear someone say 'thrown to the wolves'? Never mind that real wolves are shy, playful, defined more by loyalty than viciousness. They're far likelier to run from humans than tear into them. North American wolf attacks are almost always presaged by idiocy on the victim's part; often, offerings of food. That's not the wolf's fault, and it shouldn't be blamed. Nonetheless, the reaction of too many, on seeing a wolf, is 'shoot first and ask questions never' - a response borne of ignorance, and one that needs to change. If we don't start tearing down some of these outdated myths, the situation will never improve.

And it has to improve, guys. Things have to start getting better. Wolves are an essential part of any strong, resilient ecology; they keep ungulate populations in check, allowing trees and grasses to grow without being overgrazed. America has felt the lack of them, these past hundred years: it's no coincidence that deer now overrun many suburban neighborhoods, nibbling people's front lawns.

Look - I love wild beasts, and I know (or hope, at least) you do too. Why else would you be working for the Fish and Wildlife Department? So come on; do the right thing.

(1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Freya Freya

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving.

Sincerely,

Terri Terri

I’m not just thinking about wolves or polar bears or martens, I’m thinking about the planet. Trump and his enablers, you, won’t be happy until they’ve destroyed it and every living thing. What you don’t seem to realize is the human race will not be the last species to go. We will be extinct long before the end of life. Your children and grandchildren will hate you for allowing this to happen when you could have stopped it.

Sincerely,

Robert Robert

Washington Department of Fish and Wildlife

#1. Please do not kill any more wolves. I am disgusted and disheartened by the way Washington State has murdered loving family members of several packs. Shame on you. #2. Consider giving equal weight to the wishes of non-ranchers when deciding to slaughter wolves. Killings should be put to the general public for vote, otherwise, we're living in a "ranch-ocracy" not a democracy. #3. Instead of creating a post-delisting plan, the Washington Department of Fish and Wildlife should focus on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, taking place in some of the best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future plan, management guidance, policies and protocols — especially those that result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Washington Department of Fish and Wildlife

We must focus on wolf recovery and their conservation. Many people still do not understand the importance of apex predators and how to co-exist, so it is easy to vilify the wolf thus not needing to preserve habitat and recovery of packs. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Hello. My name is Julie Beer. One of my most exciting experiences in Yellowstone was seeing wolves in the wild. They are not just beautiful. They are important predators, a critical part of the ecosystem. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Washington Department of Fish and Wildlife

Following the next 2 paragraphs is the standard letter from the Center for Biological Diversity. I am a Certified Wildlife Biologist, now retired. A relative's son I spoke to recently told me he was out hunting deer with cousins in northeastern California. They came across a wolf. One of the cousins shot the wolf. These people, in their 50s-60s years old, grew up in a small town farming and ranching area. This is typical of many uneducated hunters. An education program is needed that informs people of the predator-prey population dynamic. The loss of a domestic animal to a wolf is a business loss. Owners of cattle and sheep must accept that and take the taxable loss. The wolf must not be shot by either the domestic animal owner nor the Department of Fish and Wildlife. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Robert Robert
Seattle, WA 98198

Washington Department of Fish and Wildlife

The wolves have barely recovered due to the state constantly killing them to keep ranchers happy. I can't even imagine how many you will kill once you've taken away their protections. Wolves serve a vital function in the ecosystem, keeping it healthier as they force ungulates to disperse instead of congregating and eating up all the vegetation. It's frustrating the you are so eager to create a "post-recovery" plan for wolves since Washington is still far from meeting the goals set forth in the current plan. WA state's current wolf management plans should really be called Wolf Killing Plans since the state never hesitates to kill wolves to keep one rancher in particular happy. The vast majority of citizens in the state, love our wolves and want them to thrive, but instead we are forced to pay the state to gun them down. We are sick of it. Therefore, Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife should instead focus its attention on current wolf-management needs. This includes: (1) Ranchers seem to intentionally graze their cattle in prime wolf habitat on our public lands. It's time to make clear that if the ranchers continue to do this, that it's essential to resolve their complaints through nonlethal means. As long as the ranchers get reimbursed when they have a loss due to wolf predation and also get the state to kill the wolves, there is no reason for them to get serious about non-lethal methods to protect their cattle; and (2) Education is the key to keeping wolves alive! You need to start conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. Why have you ignored this part of the plan?? Also, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop kowtowing to the ranchers and stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Find a way to get through to the ranchers. If they don't want to deal with wolf predation, then tell them graze their livestock out of wolf habitat. Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. The public lands belong to the public and the wildlife but you continue to allow them to be turned into large grazing lots for the livestock industry. This pro-livestock agenda has been going on way too long and needs to change if the wolves are ever going to have a chance to recover. WA state is extremely right wing when it comes to our wolves. The public wants a change and the wolves deserve a change that benefits them and allows them to do their job in the ecosystem. Cattle are an invasive species, yet they are the ones you care more about protecting. Thank you.

Sincerely,

Gayle Gayle
Seattle, WA 98133

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Protecting wolves and other natural wildlife is necessary for a balanced biodiversity and ecosystem. Do the right thing for the good of all.

Thank you for considering my comments.

Sincerely,

Georgette and Paul Georgette and Paul
Grand Blanc, MI 48439

Washington Department of Fish and Wildlife

It is shocking and distressing to me that while huge numbers of cattle are permitted on public lands, wolves, who have eons of history on the same lands, are being persecuted for being wolves. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Saint Petersburg, FL 33710

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves now is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of hurrying to create a post-delisting plan, the Washington Department of Fish and Wildlife must focus on current wolf-management needs. This activity includes the following components: (1) Resolving, through nonlethal means, conflicts between livestock and wolves which are occurring in some of the state's best habitat for wolves; (2) Conducting extensive public education on wolves. This action is emphasized in the current plan but you have not yet acted on it despite the fact that all wolf experts say public education is the single most important action for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols, and especially those which could result in wolf-killing, must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. To meet these requirements, you need to act as follows: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for your careful consideration of my comments.

Sincerely,

Washington Department of Fish and Wildlife

We have to protect America's wolves. Instead your state is doing the opposite. This is absolutely disgusting.

We have to do everything within our power to SAVE the wolves. We are encroaching on their homes and punishing them for it. First taking their habitats and then killing them? This is absurd and has to end! Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

(2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. AND If I were in charge I would simply tell the livestock owners: "Tough shit, you built a ranch in a place where you KNOW wolves make their homes, so that's your stupid fault and now you will just have to deal with them eating your animals. Sorry, but maybe next time don't put your ranch in the middle of predator country. They were here first. Leave the wolves alone!" Thank you for considering my comments! SAVE THE WOLVES!

Sincerely,

Ashley Ashley

We are a Washington family who believes in the importance of protecting nature & the wildlife who call it home. The state's wolf recovery plan must allow these beautiful & intelligent animals to live freely so their population has a chance for true recovery. Only humane nonlethal conflict resolution should ever be used if there is any issue with livestock.

The wolves habitat must be protected by remaining free of pollution, exploration & disruption by any industry interests, The wolves have an important role in the healthy balance of nature & the public has a right to be educated about the ecological importance of wolves.

Thank you for your time & consideration!

Sincerely,

Juliet Juliet

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving.

(I found it disgusting and cowardly, and also disrespectful of the opinions of a large number of Washingtonians, when the department quickly authorized wolf-killing by helicopter earlier this year. The economic interests of cattle ranchers should not take priority. The fast-approaching future calls for de-emphasizing the consumption of meat, and beef cattle take up far too many of the earth's limited resources. A horrible example: those vast fires in the Amazon, cutting off part of the world's oxygen supply --air taking priority over hamburger joints facing each other on busy corners-- as farmers clear land, kill species, to grow soybeans for cattle feed.

Expand your scope-- do not hide behind compartmentalization any more. The dietary preferences of some cannot continue to accelerate climate change, if we want our descendants to thrive, or simply survive.

The department could join with whatever researchers may be working on phasing out farsighted ranchers from beef cattle, to other ways to live on the land, not degrade that along with the water supply and the atmosphere.) Thank you for considering my comments.

Sincerely,

Ted Ted

Washington Department of Fish and Wildlife

My whole life the health and wellbeing of our wolves has been in the background as a battle. We should be further than this. But, we are not. So... Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Jessica Jessica
Ellensburg, WA 98926

Washington Department of Fish and Wildlife

There has been too much killing of wildlife in our state. And the inhumane methods used are appalling. Not only is this mindless killing a moral issue, it denies the scientific evidence that proves that healthy ecosystems are wholly dependent on wildlife such as wolves, bears, cougars, deer and elk. We need healthy forests to combat climate change and wolves are a keystone species that protect our forests. In fact, PBS just aired an episode on Nature that demonstrated how vital wolves are to keeping forests healthy. When we put human desires over the needs of other species with whom we share this planet, we are endangering all life. We should keep cattle from areas where wolves live and we should always employ nonlethal methods to keep wolves from killing cattle. If the Masai in Africa can use nonlethal means to keep lions from killing their cattle, we should be able to do so, especially since we have more technology and resources at our disposal. I believe that if you held a referendum today, the majority of Washingtonians would enthusiastically choose to conserve our wildlife. We have voted to outlaw inhumane hunting practices in the past and if people really understood the methods you have employed, I believe they would be devastated.

Thank you for considering my comments.

Sincerely,

Sharon Sharon

Washington Department of Fish and Wildlife

Doesn't matter I live in another western state, but WA needs to honor it's commitment to restoring and protecting grey wolves and see to it that comeback is protected and strong. It's time to protect our wild lands and wildlife. The planet is under enormous stress and multiple factors such as a warming planet, farming, wasteful BLM policies are creating havoc and potential extinction like we have never seen. Do Your Job! and create a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Washington Department of Fish and Wildlife

Rather than suggest to you what to include in a post-delisting plan, I am writing to urge the Washington Department of Fish and Wildlife to instead focus its attention on current wolf-management needs. Creating a "post recovery" plan for wolves at this time is premature, and misuses public resources that would be better focused on developing new and implementing established remedies to recover currently endangered wolf populations. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. I look forward to hearing about your agency's re-focus on wolf recovery.

Sincerely,

james james

Washington Department of Fish and Wildlife

“Of all the native biological constituents of a northern wilderness scene, I should say that the wolves present the greatest test of human wisdom and good intentions.” - Paul L. Errington, *Of Predation and Life* Since 2008, Washington state has experienced something promising and exciting: a wolf comeback. At the end of 2018, 126 wolves and 27 families (packs) re-established their home here. This, however, is not even close to the several thousand wolves that used to live in WA. Just two percent of the lower 48 states is still wilderness – most of our land has been industrialized, urbanized, or converted for agricultural and livestock use. Wolves typically travel great distances for prey; shrinking habitat that is prioritized for human use leaves them with very limited choices. In addition, wolves need an expansive range to disperse into separate families to increase genetic diversity and survive as a species.

Even with this knowledge, the U.S. Forest Service continues to permit cattle grazing on WA public lands, some of which are prime wolf habitat. Wolves prefer wild prey, such as elk, deer, and other ungulates. However, cattle, a non-native species in our forests, are displacing such natural prey. From 2012 to the present, 31 wolves, including entire families, have been killed by WDFW, 90% of which were on public lands. 26 of these wolves were killed at the behest of the same livestock producer who uses public lands for cattle grazing.

For years now, WDFW has claimed that they are attempting to change wolf behavior by killing wolves that hunt livestock. Yet, there is no scientific study that supports this claim. Instead, shooting and trapping wolves disrupts the social structure of the family and has shown to increase depredation of livestock. Established hunting roles become disoriented. If the older, breeding alpha male or female is killed, the family can fracture, creating more breeding pairs as a means of survival. Younger, more inexperienced wolves tend to go for easier prey. Cattle are a viable alternative to elk and deer for wolves that have not had the opportunity to learn advanced hunting skills from their elders. Ultimately, such actions by WDFW equate to a quick fix that in the long-term, produces more dire results for both wolves and livestock producers.

There are several actions WDFW needs to consider for wolf recovery in our state: (1) It is premature to consider a post-state de-listing plan at this time. There are no wolves in WA's third zone and annual population growth has been fairly small. (2) Truly teach and enforce non-lethal methods for deterring wolf depredation of livestock. (3) Ramp up public education about wolves and their true nature across the state based on science. There is a lot of misinformation out there about wolves, especially when it comes to the perceived number of livestock lost to wolf depredation, impacts to wild ungulate numbers, and danger to humans. (4) Public lands are owned by and paid for by the public. There is overwhelming support by the general public for wolf recovery and protection. With a severe shortage of wild lands for wolves to live on, WA and U.S.F.S. need to reexamine cattle grazing allowance on public lands, especially those that are prime wolf habitat. Otherwise, losses due to wolf depredation should not result in wolf killing. Livestock producers are choosing to raise cattle on these lands for private business ventures and must accept the associated risks. (5) There should be no allowance of trophy hunting and trapping seasons on wolves and no designation of wolves as game mammals. Wolf populations in WA are still recovering and they have been persecuted for far too long.

Thank you for taking the time to review my comments. I hope that WDFW develops a plan for wolves that allows them thrive in WA.

Sincerely,

Rebecca Rebecca

Washington Department of Fish and Wildlife

Wolves are an absolutely necessary part of their ecosystem. Anyone who knows anything about nature and wildlife knows that removing an apex predator from an ecosystem is an incredibly destructive thing to do. It will reek havoc on the ecosystem and all the other creatures living in that ecosystem. The endangered wolves are nowhere near the set recovery goals. Please do not allow these wolves' survival and the survival of their entire ecosystem to be put in jeopardy by deeming them in "post-recovery". Instead of demonizing these wolves, please work on creating forms of nonlethal conflict resolution and a public-awareness campaign to support their recovery. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. (4) Follow California's Mountain Lion strategy and only issue depredation permits for identified wolves that prey on livestock or other domestic animals.

Thank you for considering my comments.

Sincerely,

Joseph Joseph

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Please stop ignoring science that show that these predators are needed for a healthy ecosystem. Livestock is what tears apart a healthy ecosystem. Cut back livestock land encroachment and educate the ranchers that they can also benefit from that healthy ecosystem. Thank you for considering my comments.

Sincerely,

Sky Sky
Corvallis, OR 97330

Washington Department of Fish and Wildlife

I have followed wolf recovery efforts in WA state over the past 10 years. I have attended commission meetings, WAG meetings and workshops put on by the department. Wolf recovery throughout the state isn't in the near future. We haven't only seen packs, breeding pairs in one of the three regions that would be considered to meet the recovery goals. Wolf recovery is being hampered because of the continued killings of packs in one area. The department needs to address this before you put in time and energy about delisting. Also the department's efforts on education about coexistence between human and wolves has been woefully inadequate. You cut funding for education programs. Rather than spend staff time and the department's budget on delisting which is way down the road, it would be a better use of the department's resources to focus on bringing wolf recovery throughout the state.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Too many wolves have been killed due to complaints of a single ranching operation, i.e., Diamond M. The way this ranch operates compared with others having less "conflict" with wolves should be a huge red flag regarding its complaints to your department. I hope you will revise your agency's conduct regarding Diamond M and do not operate similarly with other ranching operations in the future. Thank you for considering my comments.

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. Having traveled and camped in areas of wolf habitat, I am aware of the extreme lack of awareness that local landowners, ranchers, recreationalists and area visitors have regarding wolf habitat needs, hunting habits and lifestyle. I believe many of the human / livestock/ wolf conflicts could be abated with better public education and ongoing information programs about the regional wolves.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. It is ABSOLUTELY CRITICAL for conserving our nation's natural ecosystem to protect apex predators, like wolves. It has been proven time and time again that wolves are a PIVOTAL AND NECESSARY part of a functioning system.

If in doubt, watch this: <https://www.youtube.com/watch?v=ysa5OBhXz-Q> Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. It is generally agreed that public education would be the single most important thing to help with wolf conservation. Please proceed in that direction. No post-protection plans are needed, until these endangered wolves are protected! There is value in keeping the top predators, such as these wolves, healthy. Please share such messaging with the general public. Thank you.

Sincerely,

Diane Diane
Sarasota, FL 34236

Washington Department of Fish and Wildlife

Apparently far from being able to meet the goals set forth in the current plan, the Washington Department of Fish and Wildlife should rather focus its attention on nonlethally resolving conflicts between livestock and wolves. It seems wolf conservation and recovery is best achieved promoting educational opportunities where a science-based, public rule-making process results in transparent, rational and enforceable strategies that support the science. The best policy is apparently to protect apex predators keeping in mind that the values and virtues of top predators is to keep nature healthy by keeping things in balance. The fact that wolves play an important role in nature needs to be appreciated.

Sincerely,

Robert Robert
Holland, MI 49423

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of rushing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through non-lethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Please save our wolves!!!! They are part of our infrastructure and provide an important structure to our wild life. Without wolves our balance of wild life will be uneven and allow certain animals that may be worse predators to flourish. Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Katharine Katharine

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Wolves are a Keystone Species, without them killing other wildlife, these other species will harm in irrevocable ways the land, the fauna, and flora which is essential for the environment in the State of Washington. Grazing cows on land destroys the land.

Washington Department of Fish and Wildlife

As a zoology graduate from UW, it greatly disturbs me that you are choosing to support land-hungry ranchers instead of a species on the brink of endangerment. Ecosystems need their apex predators and cattle can always be moved. The science does not support recent wolf killings.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state’s best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Woodinville, WA 98077

Washington Department of Fish and Wildlife

We, Washington state, are still killing wolves. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. We Washingtonians are not who we portrait ourselves to be. All environmentally savvy and aware. It's time we got our business together stop the killing.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Abigail Ann Abigail Ann
Sequim, WA 98382

Washington Department of Fish and Wildlife

The U.S. government needs to stop killing our wildlife. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Robin Robin

Washington Department of Fish and Wildlife

Wolves have always represented healthy ecosystems, commitment to family/pack, and the power of collaboration. The more I've learned of wolves over the years, the more respect and admiration they've gained from me. As stewards of the Earth and land, it is our duty to protect wolves and other wildlife.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Rather than jumping the gun to figure out how to “manage” wolves after you have successfully removed them from their ESA protections, why don’t you do your job and protect them right now from the cattle industry? The wolves belong; cattle do not as they are an invasive species and shouldn’t be allowed to graze on public lands to start with. That being said, the majority of tax payers want your attention focused on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state’s best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Annette Annette
Forest, VA 24551

Washington Department of Fish and Wildlife

I live on acreage in the Saltese Flats in Spokane County. From my early youth, I have been awed by the beauty and majesty of wolves, and dismayed by man's attempts at exterminating this species. For a state which is usually progressive and at the forefront of current issues, I am deeply disturbed by the "management" of wolves in our State, which seems to be a management involving killing these beautiful creatures for any claimed conflict between wolves and human civilization. Wolf recovery needs to be prioritized. We are not at a point where "post-recovery" can be discussed, as wolves have not recovered sufficiently .

Washington is still far from meeting the goals set forth in the current plan. Further, this progressive state must develop non-lethal methods of dealing with wolf conflicts. There are innumerable more humane and environmentally sound methods of dealing with conflict than killing a pack. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. (2) Answer the global call by scientists to protect and conserve apex predators.

Thank you for considering my comments.

Sincerely,

Ruth Ruth
Salem, OR 97302

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. This is very important. Please do this! Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Washington Department of Fish and Wildlife

Creating a plan for recovery of wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of catering to 1 ranch every year, the WDFW must focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of our national forests (public land). And following up with documented proof of their actions.

(2) Conducting public education on wolves. This is emphasized in the current plan but has not been done by the WDFW, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. Some ranchers openly call for the elimination of all wolves, this is not coexistence! Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing. There is no excuse for complete packs to be wiped out.

(2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department doesn't stop the open hostility by ranchers toward wolves. Wolves are ecologically important and worth conserving. Yellowstone has proven this fact! Thank you for considering my comments.

Sincerely,

Patrick Patrick

I'm a Washington state taxpayer that values wildlife in our beautiful state. I recognize and appreciate the importance of wolves in our state and they should always be protected. The vast majority of Washingtonians are opposed to killing wolves. With only about 126 wolves remaining and over 2 million cattle, it's extremely important to protect the few wolves we are so lucky to have. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Washington Department of Fish and Wildlife

It seems we are stuck in a fairy tale attitude of "the big bad wolf" without recognizing the science that confirms that wolves as predators protect fresh water, salmon, and forests. Certainly historical protection of livestock must be brought into the 21st century.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. I care about wildlife, habitats, environment and ecosystem balance. They are precious and irreplaceable, and should be future generations' inheritance. If we lose them, there are no do-overs. It bears repeating: IF WE LOSE THEM, THERE ARE NO DO-OVERS. Throwing away their protections kowtows to instant gratification and corporate greed. Indiscriminate wildlife and habitats ravages are bioindicators that inform the health of the environment, and it's not looking good for them or any of us. Thank you for listening and caring about our precious resources that cannot defend themselves, and their importance in our heritage and future. We need leaders that protect them and don't throw them under the bus. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

Regarding DFW's absurdly premature discussion about a "post-recovery" plan for wolves in our state.... Management of wolves in Washington has left much to be desired, in large part because of DFW's reflexive subservience to livestock growers at the direct expense of the majority public's wildlife populations. As long as DFW continues to carry the cattlemen's water, any notion of reaching a "post-recovery" phase is laughable at best. Presently, wolves are being systematically slaughtered for the benefit of Eurasian bovines at a pace which is essentially preventing their continued population growth beyond the most meager numbers. We're a long, long way from post-recovery. Rather than wasting taxpayer dollars on this pie-in-the-sky exercise, DFW should study how it might finally decouple itself from the cattlemen's hip pocket. Certainly also, we will not attain post-recovery until a robust population of wolves inhabits the Olympic Peninsula. Obviously, we've not even begun in this regard, and DFW seems unwilling to lift so much as a finger nowadays toward this essential goal. And until wolves are allowed to thrive on public lands (their native and rightful habitat) without constantly being culled, and until they are given clear priority over livestock interests on public lands, we're just spinning our wheels. Great for career bureaucrats, terrible for wolves. Moreover, DFW continues to supplicate itself to the prevailing anti-wolf sentiment in certain pockets of the rural parts of our state. There seems to be great reluctance on the part of the agency to attempt public education in order to address the many entrenched myths and misinformation surrounding wolves. DFW could go a long way toward reestablishing its credibility by placing much greater emphasis on education. For now, though, I have no confidence to speak of in Director Susewind's ability or willingness to improve this situation. I would imagine DFW's morale to be especially low as it is continually asked to cater to a handful of scofflaw cowboys who claim our public lands as their own. Frankly, it's pitiful what's happened to DFW, and I say this as a state employee who is usually highly simpatico with my fellow working stiffs in government. If recent state funding levels for DFW are any indication, I'm apparently not alone in my disdain. Please rethink your mission for modern times, at minimum.

Sincerely,

James James

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

3) Foremost, we have much to learn from this progenitor of the domestic dog. Why are we persecuting this marvelous survivor of the wilderness? Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Sharyn Sharyn

We must bring our wolf populations into full recovery before we lose them entirely. They are a vital part of the species population, to keep other species in check. Besides the fact that people love to see and hear the wolves in the wild, which brings in far more tourist dollars than the killing of these magnificent animals.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. I, like the vast majority of Americans, greatly value wolves. They are an iconic species and a crucial element in healthy ecosystems. They're highly intelligent, social, and family-oriented. They mate for life, and even raise their pups among extended family. Furthermore, wolves keep their ecosystems diverse, abundant, and healthy and this benefits all of us. Delisting wolves is scientifically unsound and politically motivated. Wolves are to blame for less than one percent of cattle and sheep losses. Rather than killing wolves, we should insist that ranchers use non-lethal methods to protect their livestock. Wolves matter. Please give them a chance to recover.

Thank you for considering my comments.

I am a mother of a toddler and an infant and we love the outdoors and animals. We especially like to read books about all of the animals my children do not get to see in our area. It breaks my heart to think about the declining population of many of the animals we read about. Wolves are one of them. They have not fully recovered and we have the chance to boost their population further. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state’s best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Amanda Amanda
Marriottsville, MD 21104

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves (and let's face it, the ranchers tend to be dopes); and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Livestock is overrated, anyway. Much too impactful. The public will be generally ahead of you on wolves and why they are good for the ecology of Washington, since scientific information is generally more available than in the past. They will also know when you lie to them to satisfy your lazy ranching friends. Thank you for considering my comments.

Sincerely,

Jon Jon
Jackson, MI 49201

Washington Department of Fish and Wildlife

As a resident of Port Townsend, WA, I support full recovery of WA's wolves in all regions. Specifically, as I live in and travel around WA's Olympic Peninsula, I'm very aware that this region has no wild wolves.

Accordingly, creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through requiring nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public outreach and education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop misusing by selectively picking biased science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current actions messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Gov. Inslee has asked that you stop killing wolves as your primary management tool, and I reiterate that request. Thank you for considering my comments.

Sincerely,

Debra Debra
Port Townsend, WA 98368

Washington Department of Fish and Wildlife

It is high time we humans stop being so foolishly human centric, especially when it comes to livestock keepers and carnivores such as wolves. There are billions of cattle in this country, one of many things humans have overdone to the detriment of all wildlife, from animals to plants to water. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Lenore Lenore
Winthrop, WA 98862

Washington Department of Fish and Wildlife

I have been watching with great interest the return of the gray wolf to its former homelands in our state. This is not the time for so-called post-recovery plans--wolves are nowhere near full recovery in Washington. Existing goals have not been met, so why waste more time and funds on a plan that is premature? Focus on the now--not on an unknown future. The Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. The vast majority of the citizens of Washington welcome the wolf. Coexistence can work--it must work, so plan for what can be.

Thank you for considering my comments.

This proposal is dishonest, as scientifically these wolves are not yet at a recovery level. Ending protection now, by downgrading protection and pretending it's "Post recovery" is counterproductive. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Louise Louise
Phoenix, AZ 85007

Washington Department of Fish and Wildlife

As a Certified Wildlife Biologist who has worked many years in wolf country, observed them in the wild, and witnessed first hand their positive impacts on native ecosystems, I hope you will take my input as that of more than just a fan of wolves. I have also served as a USDA Research Wildlife Biologist in Alaska for the Pacific Northwest Forest and Range Experiment Station. I later managed a National Wildlife Refuge Complex for the U.S. Fish and Wildlife Service and worked on plans for recovery of endangered species. My professional background and time in the field leaves me with grave concerns about this premature and ill-thought "Post-recovery Plan" at a time when the State's current plan is far from meeting its modest wolf recovery goals. How can the Washington Department of Fish & Wildlife (DF&G) claim wolves have recovered when there are as yet no wolves surviving in Zone 3 and elsewhere annual growth is stagnating? Relentless killing of wolves on public land by this department since the State's 2011 Wolf Plan has made a mess of a well-written, if scientifically dated plan that was already aiming at only socially acceptable numbers of wolves--not biologically advisable, stable or ecologically sound populations.

Further, it appears that when wolf management was handed from the Wildlife Diversity Division to the Game Management Division, a strong anti-predator mindset took hold. Under the banner of supposedly protecting deer, elk and other popular game animals from predation, wolves have been unfairly targeted.

WA State's overzealous livestock protection protocol has also lead to the wiping out of entire packs based on the demands of a handful of overly influential cattle operations.

I find it shameful that the State's wolf killings on behalf of private interests were undertaken without adhering to the existing plan's stated protocol, and certainly without honest accountability to the public. I am concerned that unsustainable wolf-culling and other violations of the State's SEPA and APA regulations will only abate with an overhaul of the DF&G. Washington needs to return to a more science-based and "non-game" management focus. We must hold the state agency that makes and enforces wolf rules responsive to the full public--a public that surveys as Pro-Wolf. If DF&G must cater to operations grazing on public lands then they must also laser-focus on resolving livestock conflicts through non-lethal means. People are tired of the State-sanctioned slaughter and the flimsy excuses that accompany it. The Department needs to educate their own on wolves and to update public information on the many positive wolf-ungulate interactions that have been well-documented in recent years. The current mindset promulgated by DF&G is old and misinformed. And perhaps foremost, rather than pushing a premature "post-delisting" plan, the Department of Fish and Wildlife needs to focus on current wolf-management problems and promote an informed and positive view of these predators.

Extensive public education on the value of wolves and their beneficial relationships to other wildlife is desperately needed. All the public hears now is misinformation from hunting lobbies and self-serving livestock interests. Wolves will never be successfully conserved without an honest accounting of their place in Pacific Northwest ecosystems and their importance in our cultures. Not only our maligned wolves, but also our public, deserve more honest appraisal and fairer treatment from our State employees. Thank you for working toward this for all of Washington's residents.

Sincerely,

Katherine Katherine

Please unite all individuals involved in the wolf recovery plan so that a meaningful wolf recovery is created. The wolf is an American icon. Please work to preserve this majestic animal. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Judith Judith
Caro, MI 48723

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management and conservation needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Keely Keely

Wolves are an endangered species that has been brutally hunted for many decades, and is also threatened by disappearing habitat. Though there have been very few incidents of wolves attacking humans, the myth of wolves as dangerous and threatening to people has unfortunately persisted. We must do all we can to protect wolves, so the species can recover and survive in America.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Wolves are beautiful animals. They are no threat to humans. Ranchers who choose to put their cattle in harms way are on the wrong path to success. It's one thing for them to complain of deaths on their own property, but when the land belongs to all Americans we will fight for our rights. Thousands of local citizens are appalled that one man can wield so much power and destruction. Wolves are needed to balance their wilderness homes, animals and their habitat. God created all life. We must respect that and fight for what is right. Please do the right thing. Thank you for considering my comments.

I have championed wolf recovery from the very beginning in Yellowstone N.P. Their return has amazed scientists with how their behavior has been the driving force for ecological recovery of the land and rivers. Wolves belong to the land. I support the full recovery before any action of "post-recovery". Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. I think human society needs to rethink its relationship with wilderness. We have a debt to wilderness. We have eliminated and all but eliminated so many species on this earth . We have replaced so much beautiful, diverse nature with industrial monoculture and highly polluting animal agriculture.

We have filled the air, earth, sea and waterways with toxic pesticides, fumes from chemical plants and fossil fuel production, cleaning products, and many other noxious substances. We have destroyed so much for our supposed benefit and comfort. Yet humans are emotionally and physically sicker than ever (if you closed all pharmacies, a huge fraction of the population would die within a few weeks or months, since so many people only survive on medications). I believe it's time for us humans to pull back, to clean up our act, to 'take' less, and to make more space for other creatures. We will feel better as a society. Imagine human population declining to levels that existed 100 or 200 years ago. There will be more space for everyone, less traffic jams, and more resources for all. Imagine kids everywhere having wild spaces to play in and explore again. Imagine the mystery, magic, and yes, danger, of having wild animals again. We need the future generations to respect nature. That also means respecting that there is a place for predators other than ourselves. Let us be humble, let us TAKE and CONTROL LESS, and we will end up having richer, healthier lives. Let us feel a part of nature again, not a species that simply dominates. I believe society as a whole will benefit.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Please allow wolf recovery to continue! With so many states stopping and allowing anti-wolf legislation to pass in their misguided nonsense of trying to control nature - your state could be a leader in the environmental movement. We need the wolf to balance and help the environment to flourish. Without this my teenage son will never know the country or world that we inherited and wasted because of out GREED and STUPIDITY! Let all species have a chance because WITHOUT THEM there is NO US!!!! Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Lynn Lynn
San Leandro, CA 94577

Washington Department of Fish and Wildlife

I respectfully urge the Washington Department of Fish and Wildlife to focus its attention on current wolf-management needs rather than racing to create a post-delisting plan,. First and foremost, this means conducting extensive public education on wolves. Despite being emphasized in the current plan and stressed by all wolf experts as the single most important action for successful wolf conservation, this all important step in the wolf recovery plan has not been pursued in good faith.

With better education, it should also be possible to gain greater support for resolving conflicts between livestock and wolves through nonlethal means. It goes without saying that ranchers should also be fully and fairly compensated for their losses since they bear the brunt of the wolf recovery effort. Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. This would mean responding in good faith to the global call by scientists to protect and conserve apex predators and using every opportunity to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Debora Debora
Medford, OR 97501

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving.

Incidentally, I lived for many years on the Olympic Peninsula with coyotes and wolves in the area. We had Great Pyreneese dogs who chased the wolves and coyotes away--there was no poisoning, no death needed. Our livestock were protected--we had great dogs who kept the livestock safe and loved and protected us, as well. And, coyotes and wolves continued to live their lives. People need to know the truth about predators--Keep your own livestock safe, and let the coyotes and wolves be--they are God's creatures. Thank you for considering my comments.

Sincerely,

Elaine Elaine

Not only is right and appropriate to save these creatures, the whole environment cannot be normal when humans "manage" the apex predators. Even vegetation is impacted. Check the science. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

I am very concerned about your plans for a "post-recovery" wolf management plan in Washington. Please focus on current management concerns -- for example, I simply can not believe that you have killed several wolves and entire wolf packs in the recent past. Wolf management should accommodate wolves on the landscape -- not killing them because of the concerns of ranchers who have done little or nothing to live on the landscape in harmony with wildlife.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Washington Department of Fish and Wildlife

I have visited the Pacific Northwest many times. My mother was a native of Washington, and until I saw the state for myself, I could not fully appreciate the extraordinary natural beauty of the place. My view of wolves, and an understanding of the respect they deserve from us, began from my mother's love of all wild creatures of that area. She was the type of person whose idea of a good coffee table book was one with photos and stories of wolves. She and I visited a sanctuary for injured wolves and wolf-dog hybrids who could not live in the wild. I recall how thrilled she was to see the wolves and how we both felt that these maligned and misunderstood animals deserved much better treatment than we humans often afford them. Over the years, I have learned that wolves are not only majestic animals but an essential component of a healthy ecosystem.

As our preference for a meat based diet dependent upon farming certain animals as "livestock" must yield to more nutritionally and environmentally sound dietary practices, it is particularly abhorrent to think of wolves being killed to facilitate and prop up an industry that should be deceasing. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Views concerning wolves have long been unjustified. When ranchers choose to graze their flocks on land they do not own and is the best habitat for wolves, they should not be surprised if there are losses nor allowed to demand compensation when there are losses. We all need to learn to live peaceably together in a rapidly shrinking environment without calling for the extermination of a species. Thank you for considering my comments.

Sincerely,

Jeanne Jeanne
Chicago, IL 60634

Washington Department of Fish and Wildlife

I have been a resident of Washington for nearly 20 years. I feel that the The recovery of wolves here is very important. I travel to Yellowstone several times a year to view wolves there and have been blessed with being able to follow their recovery there and to see the changes they have enabled. Wolves are are critical piece of the natural ecology and we need to support them.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Virginia Virginia
Vashon, WA 98070

Washington Department of Fish and Wildlife

I am appalled to learn that you are creating a “post-recovery” plan for wolves. Such a plan is ABSURD. Washington is still far from meeting the goals set forth in the current plan. Instead the Washington Department of Fish and Wildlife must focus its attention on CURRENT wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; (2) Conducting EXTENSIVE PUBLIC EDUCATION ON WOLVES. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is THE SINGLE MOST IMPORTANT ACTION to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in TRANSPARENT, RATIONAL AND ENFORCEABLE STRATEGIES.

I therefore urge you to: (1) STOP CHERRY-PICKING SCIENCE to justify wolf-killing; (2) Answer the GLOBAL CALL by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and CEASE CURRENT MESSAGING THAT PRIORITIZES LIVESTOCK over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. I hope you will seriously consider my comments.

Sincerely,

Faith Faith
Bremen, ME 4551

Washington Department of Fish and Wildlife

Wolves are critical for a healthy ecosystem. We need to do what is right for our descendants and create a better world. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. We must learn to coexist with all species. They may not be human, but in the long run, we will fail to survive if we do not follow this principle. The science has been proven for many years, and the deadlines are fast approaching. It is vitally important to preserve wolves. Thank you for considering my comments.

Sincerely,

Linda Linda

Washington Department of Fish and Wildlife

As an animal and nature lover, I felt compelled to write to you concerning our beautiful wolves. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Stefanie Stefanie
Santa Cruz, NM 87567

Washington Department of Fish and Wildlife

Today I write as not only a long-time WA resident and parent, but also as a former employee of a business with a focus on wildlife - a small, private company - and through it I learned perspectives and truths about effective animal management. I urge you to: (1) Reciprocate - utilize all stakeholders in planning; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

It's imperative that we keep this world as it was created. It's design is integral, each part being critical to the integrity of the whole. Predators have their place in the scheme of things. If mankind believes he can be the only predator on this planet, he will soon find himself without any sustenance, much to his demise. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. 4) As you are the conservation experts, teach the public why apex predators like wolves are important, to humans as well as to other species. Serve ALL of the public, not just ranchers and farmers who complain of predation when they put their livestock under the wolves' noses. What right do they have to demand that you decimate an entire species, which is supposed to be recovering? Sensible measures (i.e., an armed guard on horseback) need to be taken for animals who are allowed to range free. 5) Let the people in your state learn to form a positive attitude toward wolves. If you continue to put bounties on this species, the public will continue to think that the only good wolf is a dead wolf. Thank you for considering my comments.

Washington's wolves are not ready for a "post-recovery" plan. We haven't met the goals of the current management plan. And I feel that state agencies are still protecting certain ranchers who don't follow the rules.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Jan Jan
Winthrop, WA 98862

Washington Department of Fish and Wildlife

Wolves are a keystone species. Intact wolf packs keep the ecosystem in balance. Wolves are predators and cattle are easy pickings. Wolves lived on this land before people started killing them.

As a society we can do better. If ranchers insist on grazing on public lands, they need to assume responsibility for living honorably with wolves. Implement effective, non-lethal ways to reduce wolf predation. Instead of creating a post-delisting plan, the Washington Department of Fish and Wildlife should focus on current wolf-management needs. This includes: - Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; - Conducting extensive public education on wolves. Wolf experts say public education is the single most important action for successful wolf conservation. The public will see no reason to coexist with wolves unless Fish and Wildlife explains that wolves are ecologically important and worth conserving. - Protect and conserve apex predators. Top predators keep nature healthy, Thank you for considering my comments.

Sincerely,

Cynthia Cynthia

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. As you can see, if you read this letter, my email is Onewolfphoto@gmail.com. That means I have an affinity for wolves. What gives you, or some rancher, the right to advocate for the elimination of an apex predator, whose only crime has been keeping the balance of an ecological system? The biggest predator of all is the human! By virtue of his superior brain some would say gives him the right to “manage” natural predators. Some would also argue that as the stewards of our world and her creatures are therefore obligated to protect ALL creatures. Since when do these two ideas clash? Since Big Money ranching and agriculture has become more important than humane practices! Why not just be more interested in a balanced ecosystem instead of raking in profits for your shareholders. That is the ethical and moral way to proceed, or have you forgotten that , too? Thank you for considering my comments.

Sincerely,

Michele Michele

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. It is my understanding that there's primarily one rancher who refuses to take action to protect his cattle. This nonsense has got to stop. Thank you for considering my comments.

Sincerely,

Colleen Colleen

Washington Department of Fish and Wildlife

Creating a post-recovery plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs, with a view to a better post-delisting plan later than what we have had before. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves. This will set better tactics in place for later, as well as for now; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current, and any future, wolf plan, management guidance, policies and protocols — especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Cease current messaging that prioritizes livestock over wolves, and use every opportunity to extol the value of top predators in keeping nature healthy. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Gavin Gavin

Washington Department of Fish and Wildlife

As a young hiker in Washington many years ago, I loved wolves but knew my own state didn't have any. So, many years later, I was delighted when packs re-established a presence here. But since a number of Washington wolves have been ordered killed, and their numbers reduced, it seems more likely we will revert to eliminating them rather than encouraging them. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

I volunteer at a wolf & Wolfdog rescue in California and have learned so much about wolves. I firmly believe that wolves belong on the American landscape. After being driven nearly to extinction wolves deserve a chance to coexist with humans, They should not be destroyed when they have barely recovered even a small percentage of their former range. Wolves are intelligent and have strongly connected, complex social relationships with each other. Stop the killing of Washington 's wolves- There is no justification for killing wolves on Public lands, and wolves should not be killed for any livestock conflicts on public lands either. Non- lethal measures should always be used. Put a stop to all trophy hunting, trapping of wolves and do not classify wolves as game animals. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

We are blessed in this country to still have wolves, animals that are crucial to the balance of nature. We must for our own sake support and protect these valuable animals. There are so very few in relation to what they were, when this country's environment was thriving. We have to stop continually decimating our lands and wildlife, not just for their sakes but for our own! We can not afford to lose one more wolf! Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Please help these beautiful creatures! O not let them go off the endangered species list.

These animals are critical to our eco-system and should not be eliminated. Thank you for considering my comments.

Sincerely,

Michelle Michelle
Clayton, NC 27520

Washington Department of Fish and Wildlife

I thank you for reading my comments. The wolf is one of the most misunderstood animal in the food chain. They are essential to a healthy ecosystem, and when they thrive, the ecosystem thrives as well. Educating the public on wolves is an integral part of wold recovery, and working with local livestock ranchers is also an important part of balancing both concerns. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Washington Department of Fish and Wildlife

My family (four voting adults) and I think that creating a “post-recovery” plan for wolves, especially at this time, is absolutely premature. We know that Washington is still far from meeting goals set forth in the current plan for wolf recovery. We ask that instead of prioritizing a post-delisting plan, Washington Department of Fish and Wildlife focus attention on and support for better current wolf-management strategies and the needs of stable wolf populations for the benefit of healthy ecosystems. These strategies would include: (1) Resolving, especially through nonlethal means, conflicts between livestock and wolves, which are currently happening in some of our state's best habitat for wolves (there MUST be some habitat allocation for healthy wolf populations); and (2) Conducting extensive public and rancher education and discussion on wolves. This program was emphasized in the current plan, but has not yet materialized, despite wolf expert opinion that public education is THE single most important action for successful wolf conservation.

Under the current wolf plan (and any future ones), including management guidance, policies and protocols, especially those that could result in wolf kills, MUST be developed through science-based, public rule-making processes that result in fair, transparent, rational and enforceable strategies. We do not think solving wolf problems in the political arena is fair, wise or beneficial to any or all concerned. We therefore urge everyone in your agency to: (1) STOP ignoring the full scientific perspective to justify your wolf-killing; (2) Answer global calls by the many wildlife scientists who understand the importance of protecting and conserving apex predators; and (3) Use every opportunity to educate and inform the public on the value of top predators' role in balancing and creating healthy ecosystems. PLEASE STOP your current messaging that prioritizes livestock over wolves. Private profit should not trump ecological health, especially on public lands. People fail to see any reason to coexist with wolves if your department fails to explain how ecologically important wolves are, why they worth conserving and where they should continue to remain part of the picture in Washington State. Thank you for considering these comments from my family and me.

Sincerely,

WP Lyssie WP Lyssie

Gary Gary
Lancaster, CA 93535

Washington Department of Fish and Wildlife

Washington's endangered wolves are nowhere near the recovery goals established in the state's wolf management plan. Stop wasting valuable time and resources, and focus instead on wolf recovery and conservation. Our protected wolves need nonlethal conflict resolution and a public-awareness campaign that supports wolf recovery. Creating a "post-recovery" plan for wolves at this time is premature because Washington is still far from meeting the goals established in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs including launching an extensive public education on wolves is emphasized in the current plan but has not been achieved. AN ALL wolf experts are clear that public education is the single most important action to take for successful wolf conservation. Wolves are ecologically important and are definitely worth helping survive. Thank you for considering my comments.

Sincerely,

Pamela Pamela
Friday Harbor, WA 98250

Washington Department of Fish and Wildlife

The explain that wolves are ecologically important and worth conserving. The wolf is a beautiful animal with an intelligent family system and good parenting. Farley Mowat had it right in his book *Never Cry Wolf*. The wolf plays a crucial role in our eco-system and is responsible for culling the weak in caribou herds so the herd survives, just one of the natural balance of nature examples of it's need in our earth's survival. Please stop demonizing these beautiful animals and work to save them not extinguish them.

Thank you for considering my comments.

I am a resident of Washington State and am concerned about your agency's push for a post-recovery wolf plan. Why the hurry? The mere fact that WA State has free roaming wolves is proof that we did something right. Now we must take appropriate steps to assure these critical instruments of ecological balance continue to thrive and perform their function in our wild and open spaces.

It is understandable that the agency would want to protect vulnerable industries, but do not overreach. These animals have a value to our state's ecosystems that is greater than their impact on livestock. So while the agency's & livestock industry's concerns are valid --- they do not warrant lethal methods.

Be more creative in your prevention concepts & put people (who created the problem) at the center of the solution, such as diligence in care & protection of livestock or seek avoidance. Holding wolves accountable for killing animals that they consider prey is not rational, it is what predators do. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. I have loved wolves since I was friends with one as a little girl. They are magnificent creatures, loyal, family oriented and extremely important to the environment. Washington is one of the very lucky states to still have wolves and we must, with everything we can save, protect them and educate the people as to their importance and truly gentle natures. We can get along with them and must put them and their well being first! Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Sudarat Sudarat

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and well worth conserving. Why should wolves die brutal deaths because of life stock? Farmers need to invest in protecting their livestock without harming nature and wild animals as part of their business plan, instead of the public and these fine animals paying the price. Thank you for considering my comments.

Sincerely,

Kathleen Kathleen

Washington Department of Fish and Wildlife

I am a founding member of the International Wolf Center in Ely, Minnesota. I've seen wolves in the wild in the Canadian Rockies and at Yellowstone. Wolves are social creatures with a family life much like ours. They are shy of humans. If the loss of a little livestock is what it takes to preserve these magnificent animals, I'm happy for ranchers to be reimbursed as long as they are following the correct protocol on private land. I believe public lands are for the people, not for ranching. Please vote to save and preserve these gorgeous animals. Every creature in the web of life is connected. Wolf presence actually improves prey health, as studies at Yellowstone have proven. I want my children, grandchildren, and descendants to be able to observe and photograph wolves in the wild! Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Although my career as a veterinarian ranged from private practice to working for a corporation to teaching in a major university, my spiritual and physical renewal has always come from hiking, camping and canoeing in the wilderness. Listening to wolves howl and actually seeing a wolf in the wild gave me the greatest satisfaction.

When I heard that wolves had returned to Washington, I was ecstatic, because not only was it important to me personally, but scientific studies have confirmed and defined the great importance of predators, specifically wolves, in enhancing and maintaining an ecological balance in nature. Now I am frustrated and outraged to learn that the WA Fish and Wildlife department is spending time and money envisioning the management of wolves in a future "post recovery" situation, instead of focusing on improving and implementing the earlier (2011) Plan. As pointed out by Governor Inslee in his letter to the Director of the Department of Fish and Wildlife "The status quo of annual lethal removal is simply unacceptable." I, and a great majority of Washington citizens, agree with Governor Inslee, and ask that the Department focus on improvement of strategies to support wolf recovery and resolve conflicts with nonlethal actions.

1) Using an updated scientific approach, identify and implement nonlethal means of resolving conflicts between livestock and wolves. 2) Improve, expand and implement an effective public outreach program. As stated in the 2011 plan, "Implementation of a public outreach and education program is a high priority in the wolf conservation and management plan." This has not been accomplished. I believe that an effective public outreach program would have reduced the potential for violence that caused you to cancel public sessions discussing the issue. 3) Formulate policies that recognize the wolf as an apex predator that has an essential role in maintenance of a healthy ecosystem. This means stop prioritizing livestock over wolf recovery. Thank you for considering my comments.

Sincerely,

Richard Richard
Freeland, WA 98249

Washington Department of Fish and Wildlife

Please adopt a plan that preserves and protects wolves, which are such a beautiful and important part of nature. Wolves have as much right to be on this planet as we do. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. I am a retired teacher and counselor. I am nearing my 64th birthday. I have spent much of my recreational time hiking, camping, kayaking, canoeing, and sailing in Northeastern Washington and North Idaho. I find my personal balance and spiritual renewal in our wild places and habitats. I feel, and have always felt, a personal responsibility to advocate for our natural places and the species whose survival depend upon those places. A “post-recovery” plan for wolves is premature. Washington is far from meeting the goals set forth in the current plan. WDFW needs to focus its attention on current wolf-management needs, including: A. Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves. This is especially true regarding grazing on PUBLIC lands. I am sick of hearing from the LOUD, totally self-interested “sagebrush rebellion” and their red-neck values!! B. EFFECTIVE public education about wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. (4) Also, Wolves were here long before Europeans arrive to colonize, so they are not the problem. In fact, a lack of wolves and other top predators has created it's own set of problems in terms of ecosystem dynamics. The real problems is that worldwide there are WAY too many homo sapiens running amok over-running most of the planet either directly by residence or agriculture or resource extraction. I know the Human Overpopulation Problem isn't "your" department, but that problem needs to be addressed and not catered to in the form of wildlife eradication.

Thank you for considering our comments.

Why do we continue to try to exterminate these marvelous and ecologically important creatures? They were here long before we were and deserve to be here as much as we do. If we cannot find a way to coexist, then in my view, we don't deserve to be here.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Wolves are a crucial part of our ecosystems. They only hunt weak or injured herd animals, this reducing overcrowding of other species. We have a duty to protect them for future generations of children. As an individual, I have read extensively about the importance of their presence in balancing our other wild species populations, and their role in preserving species of grasslands by hunting only weak, older and injured animals, thus making more grasslands available for other herbivores who rely on available grasslands to live. We MUST protect wolves because we need them to balance out ecosystems and for future generations to see God's wilderness that humans need to treasure, appreciate and love so we can realize their beauty.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Is there a post-recovery plan for cattle? Cattle can live almost anywhere but wolves require other more specific natural areas to thrive in the wild. They are a part of the ecosystems that belong to all citizens, not just the cattle business owners. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. We love wolves! They are intelligent, pack oriented, caring animals that need to remain in our environment! Thank you for considering my comments.

Sincerely,

Kirsten Kirsten
Leavenworth, WA 98826

Washington Department of Fish and Wildlife

A “post-recovery” plan for wolves at is premature, as Washington is nowhere near meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Dept. of Fish and Wildlife should focus on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Nita Nita
Morrison, IL 61270

Washington Department of Fish and Wildlife

Endangered wolves in the state of Washington are still at great risk. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Fred Fred

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. You know in my own state of Wisconsin, we worry about a disease striking the deer that seems to have no solution, one of the causes they think is overpopulation. Of course the fact that they have made a concerted effort over the years to kill off the wolves that hunt them doesn't seem to occur to anyone. In Texas they have an over population of wild boars that are incredibly dangerous. Again they have killed off the wild cougars to almost extinction. Is anyone seeing the pattern here? Predators are important, and there are examples! Time to stop acting as if livestock that is harming us, and the environment are the most important thing there is.. most people don't see profit from leasing PUBLIC LAND to those chosen few. The Planet's ECOSYSTEM is FAILING and WE ARE RESPONSIBLE. Stop hiding and do the right thing.

Thank you for considering my comments.

Colleen Colleen
Lake Geneva, WI 53147

Washington Department of Fish and Wildlife

Wolves are in no way recovered in Washington state when we have wildlife services killing entire packs in order for cattle to have the land. Ranchers who work to coexist are not the problem...it the few who will not and want all wolves gone. The killings are not based on science and they are not working! They create chaos in the pack and leave unskilled hunters to prey on livestock. Our wildlife needs a place to be on our lands...but instead there are livestock everywhere. It is 2019...not 1900. We know much more now about ecosystems and the role of top predators and the damage from livestock. Tired of the fear mongering from those who spread non factual propaganda about wolves stalking children and approaching humans. Wolves simply do not approach humans just as feral domestic animals do not. They simply need to eat and live in peace! Far to much money being spent collaring and killing wolves and other top predators! Thank you for considering my comments.

Sincerely,

Debbie Debbie

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments. OUR Wolves are under attack. They do not kill for the thrill of it or because they deem another animal unnecessary.

Why should people be allowed to get away with these atrocities? I am fed up with ignorance and stupidity of this Administration and the small minded, greedy people in Congress, Ranchers and Corporations. We ALL need to protect these extraordinary animals, to remain connected to this earth, it is not only about the salvation of these magnificent, family oriented and intelligent animals, but it is also about the salvation of ourselves. SAVE the Endangered Species Act and please SAVE the WOLVES!!!

Sincerely,

Tracey Tracey
Arlington, TX 76014

Washington Department of Fish and Wildlife

Our endangered wolves deserve better than being shot from the air to protect cattle. We need a wolf recovery plan that does not include killing wolves and instead creates a working plan for ongoing community education and conflict resolution. Creating a “post-recovery” plan for wolves at this time is premature, in fact it is insulting, as Washington is still far from meeting the goals set forth in the current plan.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. I am an 80 year old woman who has always loved wolves! They are smart majestic animals who keep our Ecosystems clean and running correctly...without the wolves the plants, streams, rivers will stop growing/running properly...the deer herds will get diseases & die off...these wolves are treated unfairly now...they are being killed by ranchers who are putting their cattle on the wolves land...it's just not right after all these years the wolves have lived in harmony on their land, now to be killed by these ranchers for their cows who don't belong on this land...

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Georgene Georgene
Anderson, CA 96007

Washington Department of Fish and Wildlife

I am a retired Washingtonian, born and raised in Washington. I respect wolves and their place in nature. More needs to be done by nonlethal means to resolve conflicts between ranchers livestock and wolves. Before you kill think about what will result from this action. Please, educate Washingtonians about wolves and wolf management. They have a place in this state which should be resolved without killing them off.

Sincerely,

Audrey Audrey
Olympia, WA 98501

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Washington’s Department of Fish and Wildlife should focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists and ordinary citizens to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Therese Therese
Houston, TX 77045

Washington Department of Fish and Wildlife

Wolves hold a special place in my heart. They are beautiful, majestic animals who embody the mystery of the wild. They also play an extremely important ecological role in maintaining healthy prey populations. Their protection is very important to me.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state’s best habitat for wolves; and (2) Conducting extensive public education on wolves. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. (4) Stop driving wolves to extinction. Thank you for considering my comments.

Sincerely,

Roseann Roseann

Washington Department of Fish and Wildlife

Let me begin by saying that I am always concerned when man has annihilated species because what man wants is all that is important. Every species is valuable and sometimes we don't know why until it is eliminated. This needs to be weighted in before we eliminate another species with intent. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

I consider wolves to be magnificent creatures that are vital to our land. Deer population has increased drastically, eating away new tree groves and getting hit by cars, creating dangerous road conditions. We need wolves to manage deer population, take down old and ill animals.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Southold, NY 11971

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. As apex predators, wolves are crucial to improving the health of prey species herds, by killing the diseased and weak. When herbivores exceed the carrying capacity of the areas they inhabit, they eat things they would not normally eat, devastating the variety and health of native plants and waters. Wolves help restore the balance between prey and predator thereby also improving the local ecosystem. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. As an apex predator, wolves actually strengthen the ecosystem by culling weak, sick or overpopulated animals. When this occurs, the vegetation is healthier, therefore the remaining grazing animals are healthier. This is a benefit.

Wolves and livestock can coexist. There are proven methods that reduce loss. There will, of course, always be some loss, but that is the price paid for cheap grazing land leased by the BLM. Wolves are very important and saving them from extinction needs to be a priority over grazing animals. Thank you for considering my comments.

Sincerely,

MaryRose MaryRose

I support endangered species recovery 100%.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Joseph Joseph
Seattle, WA 98115

Washington Department of Fish and Wildlife

I am a resident of Chelan County and many of our local residents are alarmed by this predicament our State Wolves are facing and that we are constantly hearing about. I sign this petition in the hopes you will curtail anymore punitive action against the Wolves and All wildlife in our state. The unwarranted killing must stop.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

James James

I really don't understand why your dept is so adamant on destruction instead of promoting this animal who is very important to the ecological balance of nature. Nature and all the animals are very important to me and i would love to be able to see them roaming and living in their natural state.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Washington Department of Fish and Wildlife

I was born in Washington, grew up there, and the remainder of my family still lives there. I have been so distraught about how wolves have been treated in Washington, because I place a high value on all wildlife....including predators. Our wildlife is facing many pressures currently, including habitat loss, climate change, and - for many of them, intolerance and destructive practices on the part of the agricultural and livestock industries. Predators, especially wolves, are being targeted especially harshly in your state. It is your role as the agency tasked with managing wildlife, to educate the public about the critical role that predators play in balancing ecosystems, to educate in particular about the characteristics of predators such as wolves - that they are intelligent, social and family oriented, that they are not dangerous to people, and that they - in fact - are responsible for less than 1% of cattle losses.

Creating a "post-recovery" plan for wolves at this time is premature, and Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. (4) There must be a thoughtful, intelligent approach to where livestock are allowed to graze in NW Washington, particularly on public lands. Grazing allotments should be amended and re-organized to move livestock away from prime wolf habitat and prevent conflicts. The recent pattern of allowing a single rancher to repetitively push for the killing of wolves while refusing to keep his livestock away from known wolf denning sites....is just despicable and must be ended.

Thank you for considering my comments.

Sincerely,

Stephanie Stephanie

Sincerely,

Steve Steve
Rice, WA 99167

Washington Department of Fish and Wildlife

As a lifelong resident of Washington, I am very pleased that the state has adopted a wolf-recovery plan. The restoration of an apex predator like wolves not only brings back a powerful, beautiful predator to the state, but it helps restore a healthy balance to the ecosystem.

So it is very discouraging that the goals set forth in the current plan have not been met. What's more, those goals are now being undermined by WDFW's move to a "post-recovery" plan.

Given that the original goals have not been met, this move is premature, indeed.

Instead of racing to create a post-delisting plan, the WDFW should instead attend to and support current wolf-management needs and ensure they are being met. This includes the following: (1) Resolve, through non-lethal means, conflicts between livestock and wolves. Such conflicts are taking place in some of the state's best habitat for wolves and are a huge, ongoing threat to successful restoration. (2) Conduct extensive public education on wolves. This is emphasized in the current plan but has not been done by WDFW, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those that could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy and cease current messaging that prioritizes livestock over wolves.

The public will fail to see any reason to co-exist with wolves if your department fails to explain how and why wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Tina Tina
Duvall, WA 98019

Washington Department of Fish and Wildlife

I am a person that will always do the right thing when it comes to protecting animals and preserving species. There has been a lot of time and money spent trying to reintroduce these magnificent wolves back into the western part of the US. Keeping the Washington Wolves on the endangered species list is the right thing to do. They have not recovered to the level they need to be before they are delisted. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Governor Inslee I was hoping you would equate running on a an environmental platform to protect endangered species. You have a total of 127 wolves in WA and want to allow hunting???? I am so disappointed that like others you decided to not walk your talk.

Thank you for considering my comments.

Sincerely,

Christine Christine
Oregon City, OR 97045

Washington Department of Fish and Wildlife

I have been angry and dismayed that WA Fish and Wildlife have repeatedly killed wolves for a single rancher who has not moved his livestock away from wolf dens. This is a repeated failure on every level. Now WA Dept. of Fish and Wildlife acts like wolf populations have "recovered" when this is false. Now more than ever we need healthy ecosystems and wolves have proven to return ecosystems to good health. Just see the studies that have come out of Yellowstone.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. I am sick and tired of WA Dept. of Fish and Wildlife siding with wolf hating extremists, ranchers who fail to manage their own stocks appropriately, and rabid representatives like Joel Kretz instead of sound science and public interest. Do your job already! Thank you.

Sincerely,

Dr. E. Dr. E.
Spokane, WA 99208

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving.

I would do it just for the sake of the wolves, as all nonhuman species have a RIGHT to exist independent of human benefit. And ranchers have more to fear from vegans than from wolves and environmentalists.

Thank you for considering my comments.

Sincerely,

Carol Carol

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop denying science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Kathleen Kathleen
Winter Springs, FL 32708

Washington Department of Fish and Wildlife

To me protecting wolves is important because they are a key part of a healthy ecosystem, for all life. That includes humans. When one species is critically endangered, that affects the whole chain of life. I have a new grandson who will be growing up here in the northwest, and I want a healthy world for him. A thriving wolf population is part of that scenario. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. (4) The continued persecution of a necessary and needed predator is not because there is anything wrong with what the wolves due but because man wants to use all resources for their own gain and not the rights or anyone or anything else. 5) Washington state has plenty of space to allow wolf packs to survive and flourish, we have seen from Yellowstone the benefits they provide for the ecology of an area. (6) The consumption of meat is reducing and the continued destruction of the animals who inhabit these areas is unnecessary and a waste of tax payer money. Thank you for considering my comments.

Sincerely,

Elsie Elsie
Garner, NC 27529

Washington Department of Fish and Wildlife

For the last 3 years WA wolves are nowhere near the intrinsic growth rate of 24% that I used in my wolf population model for wolf recovery in the WA recovery plan. Current growth rates are 3- 6%, nor the 24% ,envisioned in the recovery plan. Losses of wolves to 1 particular livestock operator has stalled population growth, immigration, and recovery. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. On a personal note: Why are certain people so afraid of preserving and increasing wildlife populations, particularly, those that keep a check on the populations of deer, elk, etc. who tend to overpopulate and then starve for lack of food? Thank you for considering my comments.

Sincerely,

Stefan Stefan
Tampa, FL 33604

Washington Department of Fish and Wildlife

I live in The Dalles, with a view over the Columbia. river to Washington. I hike in your beautiful state often, and believe generally that your state has a good environmental record, actually better than Oregon's. I learned about wolves, and their precarious position, as a child in the 1960s in California. My parents belonged to an environmental group and we got an LP of wolf calls that was utterly gorgeous music. Wolves are so important to the natural world, an apex species. They have an amazingly sophisticated family life, and are very intelligent and beautiful. You must focus on their recovery as a species and educate the populace to their value. I have been so glad to see the wolf population slowly grow again. Your proposed plans break my heart. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Janet Janet
The Dalles, OR 97058

Washington Department of Fish and Wildlife

I've been lucky to visit some of the great western states where nature and wildlife are protected. Wolves are an important part of the ecosystem and need to be protected forever. With all the stress of climate change and habitat loss, let's worry about increasing wolves population first. It sounds like greedy killers can't wait to kill wolves again. Your department is supposed to protect and nourish nature and wildlife, not destroy it. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. I agree with the Center for Biological Diversity's letter, of which I'm sure you will receive thousands of copies and variations. I have only one thing to add, to remind your department of the importance of wolves to the ecosystem: a short, three and a half minute documentary film, How Wolves Change Rivers: <https://www.youtube.com/watch?v=6dk0DGCa7ow> To protect our ecosystems, we have to protect wolves -- that means nonlethal conflict resolution and a public awareness campaign that educates people about the need for wolf recovery and protection. Thank you.

Sincerely,

V.L. V.L.
Durham, NC 27705

Washington Department of Fish and Wildlife

I am Ally Wilkinson, I believe that wolves are immensely important to the ecosystem that they live. So much that taking wolves out entirely is just as devastating as taking water out entirely. Wolves are the keystones and are so necessary. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Ally Ally
Ellicott City, MD 21042

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through NONLETHAL means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves (which should NOT be leased out to ranching interests); and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Claire Claire

Washington Department of Fish and Wildlife

Wolves are a natural and necessary part of the balance of nature and wildlife. Since their protection and reintroduction is very, very recent in terms of the natural world's timeline, I urge you to pause and if there is any error to be made please err on the side of caution.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

Please realize that wolves are always in recovery. It only takes a very small amount of time if protections are loosened, for them to be endangered all over again. Please do not opt for less protection. I firmly believe that even stricter protections are necessary. All too often, tragedies concerning wolf family dynamics are being destroyed by those who are bent on hunting and trapping all the while luring them to go beyond protected areas. Legislation should be put in place to penalize by mandatory jail time and fines, and loss of property used in the crime. Those funds could help continue protections for our essential wolves and their habitats. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

I am very concerned about the overall biological integrity of both Washington state and the entire planet. Wolves in the ecosystem play a very important role in creating healthy wildlife scenarios. As such, it is imperative that wolves be encouraged to take their rightful place in Washington's remaining natural ecosystems. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Washington Department of Fish and Wildlife

I've lived in Washington State since 1989. I love the natural NW beauty and am an avid hiker, nature lover and animal advocate. I can't imagine living anywhere but here. I live in Renton next to a greenbelt. I have rabbits, deer, black bears and bobcats visit my property. All animals have intrinsic value and that value cannot be undermined by the needs of a few livestock owners. Any plan the department makes needs to reflect that the state holds wolves in trust for all of the public. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Annual growth is stagnating, the numbers in existing wolf packs is too small. The recovery goals are far off. Instead of rushing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves. Through educating and mandating that livestock owners use fencing, guard dogs and other methods known to deter wolves. (2) Conducting extensive public education on wolves. People need to be educated that wolves do not decimate ungulate herds in other western states and they can help stop the spread of chronic wasting disease. Wolves are necessary and important to our ecosystem. Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Never sanction hunting or trapping of wolves or designate wolves as game mammals.

(2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves.

Thank you for considering my comments.

Sincerely,

Laura Laura
Renton, WA 98058

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving -through nonlethal means- conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done yet, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies, and protocols -and especially those which could result in wolves being killed- must be developed through a science-based, public, rule-making process that results in transparent, rational, and enforceable strategies. Therefore I urge you to: (1) Acknowledge the research and statistics of wolf protection; (2) Answer the global call by scientists to protect and conserve apex predators (3) Use every opportunity to explain the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if there is a failure to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. I will not comment on all the ideas, good and bad, put forth in this letter. However, I have read hundreds of articles, mostly outlining the benefit of key predators and the wolf is definitely in this category. Without the benefit of the wolf in culling old and weak mammals, the forest would soon become ravaged by overgrazing and all concerned would suffer. Please make decision based on what is best for the future of the environment.

Thank you for considering my comments.

Sincerely,

Ken Ken
Escondido, CA 92029

Washington Department of Fish and Wildlife

The wolf population has not recovered yet. If DFW lifts hunting/killing bans, wolves will be hunted to extinction. They are valuable to keeping natural balance in their territories by hunting the animals that could become a pestilence if their numbers are not controlled naturally by this apex predator. Wolves are magnificent wild animals that should be protected. Ranchers have means to protect their livestock — i.e. powerful motion-activated lights to scare wolves away and electric-shock fencing to discourage wolves from entering their fields. The Wolfe population has not recovered enough to declare open season on them and they could become extinct in that geography due to eliminating their protections prematurely. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Sincerely,

Patricia Patricia
Los Gatos, CA 95030

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Governor Inslee claims to be pro-environment, but a wealthy rancher has declared war on wolves, grazing his cattle on public land often intentionally next to wolf dens and even planting dead and dying cows near wolves to make them look like victims of wolf attacks. The state of Washington, including The Washington Dept of Fish and Wildlife, and the governor have sided with this rancher over wildlife, including wolves. Grazing allotments on public land, welfare ranching and the ensuing environmental damage should not be allowed.

We were considering more visits to Washington State, and even moving there, until it became obvious that the state is now anti-wildlife and at war with wolves. Wolves appear to be the best defense against Chronic Wasting disease, and can offer defense against brucellosis.

Additionally, evidence shows that often killing wolves and destroying the cohesiveness of a pack actually increases predation on ranch and farm animals. This is especially true when the younger inexperienced animals lose their teachers that help them learn about bringing down wild prey and resort to domesticated “easier prey”. It's a shame that wolves have more "humanity" than many or most people. Boycott Montana, Idaho, Wyoming, Wisconsin, Washington, Oregon, Minnesota, Michigan and Alaska as long as they allow or condone wolf killing. Stop eating beef. Ranchers are the prime impetus on the war on wolves. We also must vote the federal, state and local politicians out of office that support this slaughter. Let's make these cruel politicians endangered species (be they republicans or democrats). Cruel traps must also be made illegal. They inhumanely slaughter wildlife and pets alike.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Lawrence Lawrence
North Fort Myers, FL 33917

Washington Department of Fish and Wildlife

Your planning for after the de-listing of the wolves is fool-hardy.

First things first, let's face that Washington Department of Fish and Wildlife needs to honor the value of wolves.

If you allow for the killing of these Apex Predators, like the rigging on a ship, Nature's delicate balance will be upset with concomitant and disastrous results for the entire animal kingdom, including man. Please keep all protections in place for critical wolf recovery and conservation.

Order your priorities: Wolves are still an endangered species!

Sincerely,

Beverly Beverly
Encino, CA 91316

Sincerely,

David David
Ocean Shores, WA 98569

Washington Department of Fish and Wildlife

I am concerned that the department is prematurely planning for delisting of the gray wolf before populations have recovered to a sustainable level. Please make sure that scientists are the primary input as to when populations have reached a sustainable level. In addition, I have been concerned that management of wolves has been largely on the behalf of a few special interests in the state, in particular ranchers who have never supported return of wolves. However, the majority of the state has expressed motivation for wolf recovery, and wolves are existing primarily on public lands and should be managed for the interests of everybody. Ranchers using public lands for grazing should have to assume some of their own risk of loss rather than having subsidized risk by the public and against the interests of the rest of the state in maintaining healthy wolf numbers. Lethal management of wolves on public lands should not be part of the wolf management plan, especially when it is consistently on behalf of a very few interests in the state. Wolf recovery is certainly not without risk to people and livestock but the residents and administrators of the state of Washington have already decided that the benefit of wolves to our ecosystem, wildlife and wild lands exceeds that risk, and so they should be managed in a way that fully supports their recovery. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Wolves belong! Thank you for considering my comments.

Sincerely,

Dawn Dawn
Placitas, NM 87043

Washington Department of Fish and Wildlife

Please protect our wolves! Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Belchertown, MA 1007

Washington Department of Fish and Wildlife

It is appropriate and reasonable for humans to plan for how many wolves or other creatures are numerous enough to decide that we have "enough". There are several problems, however, with our plans: (1) They are, particularly in the case of wolves, a result of a highly political process with many economic interests at play; (2) these plans cannot take into account natural occurrences that may decimate wolf populations, such as contagious diseases creating massive die-offs; (3) Those who benefit from having a wolf-free environment will continually try to limit the number of wolves in Washington State in order to fulfill their economic objectives (4) wolves go where there is prey. Expecting wolves to exist in densely populated areas is highly unrealistic. There are other problems, however the truth is before us -- there are not now "enough" wolves, even by our own planning documents, to begin to have open hunting seasons or poisonings or other destructive measures. The management of wildlife is important as we have created depleted environments and habitat, however, I often wonder how many humans we declare are "enough", or house cats, or crows, for instance. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

Washington is still far from meeting the goals set forth in its current plan for wolf management in our state. We need to meet those goals BEFORE any further actions. The Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Top of the list is educating farmers and the public at large about why wolves are important. Then: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, a science-based, public rule-making process must be in place, one that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Angeline Angeline
Seattle, WA 98105

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. The current plan doesn't even go far enough, and stating that the recovery has already occurred is a gift to ranchers.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. There are multiple non-lethal ways to prevent wolves from killing livestock. The land is the natural habitat for the wolves, It's not for cattle. Killing wolves doesn't help the ecological balance that is much needed in America. Thank you for considering my comments.

Sincerely,

Nancy Nancy
Hiram, GA 30141

Washington Department of Fish and Wildlife

This hunting call for wolf hunting is untimely on account of the population not having fully recovered in the state. Rather than check to see if the environment was suitable for raising livestock, you instead rushed at the chance and are now intruding on the homeland that belonged to someone else and trying to eliminate them. Sound familiar at all? By not waiting for their numbers to heal and using safer alternatives for handling them, you're betraying the very rules and regulations you have sworn to uphold. Other wildlife departments have obeyed the rules of wolf conservation and found success through nonlethal means and science-based education programs, so why aren't you doing the same? I urge you to stop cherry-picking science to justify wolf-killing. Answer the worldwide call by scientists for apex predators to be protected and conserved and use every opportunity to recognize the importance of top predators in maintaining nature's health and to stop misinforming the public that livestock are more important than the shepherds. If the Department fails to clarify that wolves are ecologically essential and worth preserving, the public will see no reason to coexist with them. Thank you for taking my words into consideration.

Sincerely,

Geoffrey Geoffrey
Poulsbo, WA 98370

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. It does not seem like enough time has passed to even be in a post recovery plan. Recovery plan I would think would still be in place and needs improvement. So I agree with much of what is posted in this letter below. Education, a strong and heavy set of fines for killing and especially not reporting a kill. I have always been opposed to purposefully killing animals that we are trying to make a recovery, and especially with some of the cruel and unusual methods being used. If an animal is truly a problem, trap it and move it. They are animals. We need to have more empathy for what they are and how they should live. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Peter Peter
Naperville, IL 60563

Washington Department of Fish and Wildlife

I am very concerned about current and future wolf conservation. Wolves are necessary to maintain healthy ecological systems. Protecting wolves is therefore reasonable and necessary. Where conflicts occur, use of non-lethal methods should be the priority. I believe that developing a “post-recovery” plan for wolves at this time is premature. Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife should instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Casey Casey
Chapel Hill, NC 27516

Washington Department of Fish and Wildlife

Imagine you were dying from cancer, but had shown some improvement. Instead of saying it's great that you're on the right track, your doctor came in and said: "great! Looks like you're all better, let's start planning what you'll do now that you're all better." Washington is still nowhere near meeting the goals set forth in the current recovery plan. Just like the doctor who should be focusing on treating his ailing patient, the Washington Department of Fish and Wildlife must focus its attention on current wolf-management needs. This includes a number of things that will actually help with post-recovery planning:

1. Figure out how to resolve conflict between humans, livestock and wolves via nonlethal means. As the wolf population rises, so will the number of encounters. Test run non-lethal measures now while the population is lower so you'll be prepared once the population meets recovery goals.
2. Teach the public about wolves. People fear and mishandle what they don't know about. Experts say public education is the single most important action to take for successful wolf conservation. As such, this could wind up being quite the money-saving measure. The current plan emphasizes education, but little has been done.

3. Develop further plans through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. In summary: (1) Stop cherry-picking science to justify wolf-killing.

- (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Anne Anne

Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. I hope that wolves being delisted is not a foregone conclusion in the Department's mind. Thank you for considering my comments.

Sincerely,

Catherine Catherine
Denver, CO 80223

Washington Department of Fish and Wildlife

Dear Washington Department of FWL, Knowing the positive impact wolves have on the environment it is imperative to use the best science and to update the plan for complete recovery of the species.. Wolves are not GAME animals and trophy hunting must not be allowed! Further, there should be NO killing on the public lands in our state should depredation of cattle occur on these public lands. In addition non-lethal deterrents should be enhanced and a last resort. The impact of ecotourism should be considered. Folks want to see wolves in the wild. Wolves are majestic, iconic creatures and I and 75% of Washington state residents want wolves in the wild.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Tryna Tryna
Seattle, WA 98106

Washington Department of Fish and Wildlife

Washington state is not a cattle ranch. Attempts to manage it as such have resulted in the unnecessary destruction of natural values. Ecologically speaking, cows do not belong in Washington. Wolves do. Respecting biological reality will put you on a path to sane management. You can not allow one rabid rancher to derail sensible, humane wildlife management and much needed wolf recovery.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Please listen to the experts (ones not motivated by their own short-sighted, personal gain). As your neighbor in Oregon AND having been born in Seattle I want to remind everyone that wild animals don't understand our invisible lines. They don't KNOW where to hunt, where it's safe and where it's not. If you kill wolves in your state, it impacts other states. There has to be a way for peaceful coexistence with nature. Lets not be lazy and take the easy way out....why is killing anything an easy way? Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Sincerely,

Jean Jean
Livermore, CA 94550

Washington Department of Fish and Wildlife

Washington is still far from meeting the goals set forth in the current, “post-recovery” plan for wolves, so revising the plan now wouldn't be appropriate. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife should focus on current needs for wolf management needs, including the following: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan, but has not been done, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. It is imperative for the Washington Department of Fish & Wildlife to make the following changes: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; (3) Use every opportunity to declare the value of top predators in nature, and cease current messaging that prioritizes livestock over wolves.

Sincerely,

Scott Scott
Saint Paul, MN 55110

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. It undermined the belief that you are actually concerned about the fate of this species.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation. The more people know, the better the chance they have to make choices that benefit all.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Rachel Rachel
Indianola, IA 50125

Washington Department of Fish and Wildlife

I love wolves. They are amazing creatures with as much right to their lives as you and I. We've killed a hell of a lot more of them than they have of us. We need to allow them to recover. Ranchers and other wolf haters must be forced to learn how to co-exist with wolves, with public support. We are a smart species. We can figure out how to live with wolves without continuing to exterminate them. They don't deserve it.

My wife and I lived in Washington State for 30 years and raised our children there. We still care deeply about what happens there. We now live in the neighboring state of Idaho and what happens to wolves in Washington affects wolves in Idaho and vice-versa. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. FOR A KINDER, SAFER, HEALTHIER and M O R E J U S T WORLD>>> EACH and EVERY ONE OF US is RESPONSIBLE>>> The most DESTRUCTIVE force of nature is ... HUMAN NATURE ... because it can choose>>> Without REVERENCE for ALL LIFE and ALL that GIVES LIFE there can be no PEACE...only pain, suffering, misery, fear and death>>> OUR M O R A L progress depends on and is judged by how WE treat ALL LIFE and ALL that GIVES LIFE...TRAGICALLY...WE HAVEN'T PROGRESSED...yet>>> Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Jerry Jerry

Why are you even discussing this? Most Americans and Washingtonians want the wolves left alone. It is only the ranchers and public officials that want to kill them.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. I am someone who believes strongly that all our wildlife needs protection in this day of gung-ho hunters. Especially wolves. It seems that instead of trying to preserve these magnificent animals, some wish to make it easier for them to be slaughtered. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. It is way too early to put together a "post-recovery" plan for wolves. Wait until the wolves actually ARE recovered as a population. In the meantime, please focus on improving current protocols for mediating wolf/rancher disputes and on public education regarding the value of wolves in maintaining a healthy ecosystem and how to support wolves while mitigating public and private conflicts.

Furthermore, for all current and future wolf plans, management guidance, policies and protocols must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Thank you for considering my comments.

Sincerely,

Kristin Kristin
Willington, CT 6279

Washington Department of Fish and Wildlife

I live in Port Townsend, a town over run by deer. I love the deer, but hate to see them hobbling around because of car collisions, and getting caught in fences as they try to find something to eat (more and more fences are going up in efforts to protect landscaping, leaving little food, especially during a drought). The deer population is unhealthy, but we have no way to cull the herd to a sustainable size.

I mention this because it reminds me that having no apex predator, except for human hunters (banned in town, of course) always creates an unhealthy, unsustainable population. Human hunters, unlike wolves, target the biggest prime animals instead of culling the weak, diseased, old, or sickly ones. Disease spreads. I would think the livestock owners would prefer not to expose their herds to disease from wild sources. Instead of attacking wolves which keep wildlife healthy, just pay livestock owners for any losses from wolves. They shouldn't be grazing in wild areas anyway. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. What is needed is nonlethal conflict resolution and a public-awareness campaign that supports wolf recovery. What I do not understand is why wolves are do demonized by human beings when they are just trying to live and raise their families just as we are. They have a right to do so and should not be murdered for sport. Only humans beings kill for fun--it is shameful. The negative impact of wolves on livestock has been exaggerated. There are non-lethal solutions to that problem. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

I'm writing to you as an educator with WolfWays, an organization co-sponsored by Wolf Haven International, whose director is a member of WAG. WolfWays provides free, science-based wolf education programs to schoolchildren in NW Oregon and SE Washington.

It seems to me that instead of making "post-recovery" plans, WDFW should be focusing its efforts on providing extensive public education on wolves, focusing on their complex social lives and on their value in balancing ecosystems. The current plan lists public education about wolves as a goal, but this goal remains largely ignored and unmet, even though education -- along with valuing wolves' lives enough to refrain from killing them -- is crucial in increasing social tolerance. This is something I have experienced directly in my work as an educator. And where there is social tolerance, wolves stand the greatest chance of maintaining a stable population and doing their absolutely crucial job as apex predators. If you look at the growth trajectory of Washington's wolves, it's obvious that the recurring sprees of wolf killing by WDFW have taken their toll on recovery, as population growth overall has leveled off, and there are still no packs in one of the state's recovery zones. I fear that if Washington delists wolves, there will be pressure to institute a wolf hunting and trapping season even though there is absolutely no biological or ethical justification for killing wolves for sport. Wolf hunting would be a disaster not only for wolves' population numbers overall but also for their family life and culture. I fervently hope that any new plan that is developed for Washington's wolves will incorporate the best available science, will entirely rule out the killing of wolves on our public lands, and will prioritize the values of non-consumptive stakeholders, who after all represent a majority of citizens both in Washington and in neighboring states where wolves are likely to disperse.

Thank you for considering my comments.

Sincerely,

Mary Anne Mary Anne

I believe our survival depends on the survival of ecosystems, and the mass extinction of predators around the world is a sign that ecosystems are in real trouble. Wolves are a long way from being recovered.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Leannah Leannah

Washington Department of Fish and Wildlife

People who run the WDFW are employed by folks like me, the taxpayer, to CARE about and protect WILDLIFE. DO NOT de-list wolves. Keep protecting them. START really protecting cattle by enclosing them in areas that are safe, at their owners' expense. Stop allowing cattle to roam free in wild areas where wolves naturally live and cattle DON'T. Stop inviting potentially lethal interactions between wild and non-wild animals on MY public lands that ranchers "rent" for a pittance. The land belongs to the wolves. Stop setting the wolves up for failure and the cattle, for injury. Move the cattle. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must focus its attention on wolf- and cattle-management. This includes: (1) Resolving conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves by moving the cattle; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. PLEASE: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. DO YOUR JOB. STOP KILLING OUR WOLVES. WE NEED THEM. Thank you.

November 1, 2019 TO: WASHINGTON STATE GAME DEPARTMENT/FISH & WILD LIFE To Whom It May Concern: I write to inform you that I am a wolf advocate and that I am incensed that the Game Department is wiping out entire wolf packs in this State because a few cattlemen complain about wolf kills. Wolves hunt in packs and they prefer ungulates they find in the forests. They can carry their kill back to the den to consume as they need to.

In addition, cattlemen that are using federal land to graze have no right to expect the Game Department to do their bidding and kill on those public lands that we, the people, own.

My Group, The Center for Biological Diversity, is suing for protection of the wolves in Washington State and I support that endeavor. I also hope the Court fines the Game Department for not even attempting to find a non-lethal method of dealing with the few wolves that are responsible for cattle kill.

Please help us to find a compromise to this problem. The wolf is a magnificent creature and we are blessed to have them reintroduced to our state. Wolves should be held in public trust for all the people and protected.

.

Washington Department of Fish and Wildlife

We absolutely don't agree with taking wolves off the endangered species list. That will allow a massacre of these noble creatures by the ranching lobby that hates them so much. We would like Fish and wildlife to actually protect our native animals rather than serving as a "killing machine" with our taxpayers money.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Mukilteo, WA 98275

Washington Department of Fish and Wildlife

My name is Maggie Topalian, and like so many other Americans, I am a lifelong animal lover who wants to see this country's wildlife populations restored to their natural, healthy levels. As such, I am writing in defense of Washington's wolves, who are still in dire need of protection. All efforts need to be going towards further wolf recovery and habitat preservation, not wasted on coming up with ways to exploit and abuse these irreplaceable animals under the euphemism of "managing" populations. Given that Washington's wolves are still very much endangered and nowhere near the goals already established under the current recovery plan, creating a "post-recovery" plan for wolves at this time is not only premature, but scientifically baseless and unethical.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Sincerely,

Jane Jane
Hydes, MD 21082

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. We've already almost lost them forever once, please don't let it happen again.

Wolves are an asset. People want to see them in the wild and go to places with large populations in hope of a glimpse of one in the wild.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Megan Megan
Bloomington, IL 61701

Washington Department of Fish and Wildlife

I am writing to express my support of the recovery and sustainability of wolves and their status as a protected and essential wild animal. I have read the issues and debates about the reintroduction of wolves; knowing that people can be passionate about wolves and their perceived contributions or detrimental effects. Research/science has shown that apex predators, particularly ones with a proven positive impact on the wild eco-systems bring a natural balance to their environment that benefits us all. I am encouraged that the WDFW and Commission are examining their procedures and protocols and their actions. Consider all the reasons that we have for supporting such an iconic creature and our reasoning /intent behind the Endangered Species act. I have seen wolves in the wild and those in sanctuaries and educational centers. These animals enrich our lives and our hearts.

Please consider a fair, equitable response for both the humans with a financial motive and the wild animals that were almost eradicated in this country. The Washington Department of Fish and Wildlife must have as its focus addressing current wolf-management needs. Using current science to resolve conflicts through nonlethal means combined with extensive education of the public on the essential value of wolves is crucial for all our state.

Under both current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — MUST be developed through a science-based and public rule-making process that results in transparent, rational and enforceable strategies.

Wolves are ecologically important and worth conserving!!!

Sincerely,

Elizabeth Elizabeth
Freeland, WA 98249

Washington Department of Fish and Wildlife

Hi, my name is Aspen Gibson, and I'm an 18 year old college student currently working towards my Bachelors of Wildlife management. As you can already guess, I desperately want to save the Washington wolf population, being a resident of Washington myself. My goal in life is to help these animals survive and thrive for the coming generations, but I can't achieve my dream if they become extinct. Please, reconsider your actions on behalf of anyone who appreciates one of nature's most beautiful and intelligent predators. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Nancy Nancy
San Jose, CA 95135

Washington Department of Fish and Wildlife

I am an attorney in Washington State. I am a former chairperson of the Washington State Bar Association's Animal Law Section. My comments are my own and do not represent the views of either the Bar Association or the Animal Law Section.

Over the past 35 years I have had many interactions with the Washington State Department of Fish and Wildlife and have found that, in general, they are no friends of wild animals. They view their jobs as being supporting hunting, fishing and trapping, as well as working to protect the interests of businesses. Their hostility towards wild animals is readily apparent. WDFW is wasting huge amounts of taxpayer dollars by its efforts to create a “post-recovery” plan for wolves at this time. Our state is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, along with the accelerated killing of wolves, the Washington Department of Fish and Wildlife should be focusing its attention on current wolf-management needs. These are outlined below: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; (2) Actually engaging in public rule-making regarding state policies on wolves; and (3) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by WDFW, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop either ignoring or cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. It is clear that WDFW is working to further the interests of ranchers and private businesses to the detriment of wolves. Why spend millions of dollars to reintroduce wolves when, once they have been reintroduced, you want to spend millions to wipe them out? This is a complete waste of taxpayer funds.

Sincerely,

Cheryl Cheryl
Spokane, WA 99205

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. I am a wildlife biologist, and the health of Washington's ecosystems cannot be sustained without wolves. Do the right thing for our planet and our future. Thank you for considering my comments.

Sincerely,

Jenna Jenna
Fort Collins, CO 80524

Washington Department of Fish and Wildlife

I have long been concerned about the future of the Washington's wolves. They are part of the ecosystem of the pacific northwest, and they have a role to play. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. I do not approve of delisting at this time. The Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Donna Donna

Washington Department of Fish and Wildlife

My name is Tracey Loyd. I am a veteran and a citizen by birth in Washington state and I have lived here for almost all of my life. Now as a disabled senior citizen, one of my greatest joys is remembering the years I spent as a hiker and a camper in Washington, starting from when my dad took myself and my brothers camping as children. But even though I went into many wilderness areas I never heard wolves until I went to Yellowstone in 2014. That visit and the things I learned about wolves, crystallized my attitudes about wildlife recovery. Simply put, we need wolves. They are essential to a healthy ecosystem and we have far, far too few of them to realistically consider them recovered. Before you consider changing their status I urge you to research what their reintroduction has done for Yellowstone. It would be well to have the same positive changes occur in Washington state. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Tracey Tracey

Washington Department of Fish and Wildlife

The time for creating a post-recovery plan for wolves has not arrived yet. Given that tWashington still has a long way to go before reaching the goals of the present plan. The Washington Department of Fish and Wildlife should focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Catherine Catherine
Durham, NC 27713

Washington Department of Fish and Wildlife

Please don't waste time and taxpayer \$ on a premature post-recovery plan when wolves haven't even recovered yet in Washington. Wolves have been shown to benefit those historic ranges where they've been reintroduced, and allowing them to repopulate Washington is good science, good for tourism, and good for the economy. Work also toward establishing nonlethal conflict resolution processes. IT CAN BE DONE. Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Although I am a layperson from the perspective of conservation biology, even I have access to sufficient information to appreciate that the return of wolf populations is an extraordinarily important and even essential step in protecting and restoring what little remains of America's wildlife and wildlife habitat. Since you are nowhere near achieving this goal, I can only guess that you wish to promote post-recovery plans as a method of disguising your limited progress, or alternatively, in an effort to deceive the public as to the program's current status. Surely you are not attempting to reassure hunters and ranchers that they will be permitted to destroy the wolf population once again should it actually manage to recover to any appreciable extent. Please prove that my worst suspicions are unfounded by dropping this premature effort to declare victory and retreat from the field. You clearly have much work left to do that is actually necessary to a successful wolf recovery program, Thank you for considering my comments.

Sincerely,

Robert Robert
Charleston, WV 25314

Washington Department of Fish and Wildlife

Without apex predators, entire ecosystems get thrown out of whack. Consider the story of how bringing wolves back to yellowstone made the whole park healthier & improved the river. We need wolves and we need to find a way to co-exist with them.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Glenn Glenn
Everett, WA 98208

Washington Department of Fish and Wildlife

I care deeply about the environment and wolf recovery is critically important to me. Nonlethal measures should be tantamount and supportive programs that allow for wolf packs to regain their normal territories and growth should be implemented. All forms of "population control" (ie. aerial gunning/killing them in their dens/trapping/etc) should be completely scrapped in favor of a program that balances nature, which would be allowing for full wolf recovery.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Jamila Jamila
Stafford Springs, CT 6076

Washington Department of Fish and Wildlife

Though the rancher-wolf conflict is at the heart of the matter, nothing has been solved by killing wolves and making no alterations in land management. World wide cattle are taking over forestland and altering natural ecosystem functioning. Science, ecosystem services, and education are paramount in solving human conflicts that throw natural systems out of balance. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Wolves need protection. They are necessary to keep nature's balance in place.

Sincerely,

Barbara Barbara
Bremerton, WA 98312

Washington Department of Fish and Wildlife

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Please realize that all animals were here before man came in and took their homes away from them. It's not their fault that man is so egotistical that they can't think beyond their own selves. If anything, we should be weeding out man, not animals. All animals are being forced from their homes everyday. Since we are capable of doing something about it, it is our job to in fact DO something to protect the wildlife and restrict humans from stripping the ways of the wolf and all wildlife from out from under them. Thank you for considering my comments.

Sincerely,

Megan Megan

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments. This, along with Climate Change, is one of my major concerns. So many people have dedicated their lives and resources to Saving Wolves. Endangered Species appear to be on the administration's 'hit' list. I do understand that livestock and their wealthy owners want more grazing lands and Wolves are top predators and need a space to live, but for the Western States, including Washington need to keep our Wildlife and Protect them from unnecessary harm. Say no to expansion of livestock. I love cattle, but I think having Wild Populations of Wolves is more important.

Thank You

Sincerely,

Cynthia Cynthia
Oceanside, CA 92054

Washington Department of Fish and Wildlife

Washington's endangered wolves are nowhere near the recovery goals established in the state's wolf management plan. More than one-third of U.S. land is already used for pasture—by far the largest land-use type in the contiguous 48 states. Between pastures and cropland used to produce feed, 41 percent of U.S. land in the contiguous states revolves around livestock. A single cow releases between 70 and 120 kg of Methane per year. Methane is a greenhouse gas like carbon dioxide, but the negative effect on the climate of Methane is 23 times higher than the effect of CO₂. We don't need to expand the area used to graze cattle. We need to drastically reduce it. We should be doing everything possible to reduce the causes of climate change.

Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Gary Gary
Madison, WI 53704

Washington Department of Fish and Wildlife

Seeing a wolf in the wild is awe inspiring. They are still endangered, so why is the state working on post-protection plans? Don't employees have more important things to work on? Yes, they do including focusing on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. D D
Apex, NC 27539

Washington Department of Fish and Wildlife

I'm asking you to please protect our wolves. Now is not the time to start creating a "post-listing recovery" plan for wolves. That would be premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Tanya Tanya
Seattle, WA 98115

Washington Department of Fish and Wildlife

Wolves have a ways to go before they are “post-recovery”. The wolves are a crucial part of our ecosystem and their existence promotes a healthy environment for Washington. People and wolves can learn to co-exist for the good of all. Be patient with the uninformed people as they have not had wolves in their world for long.

In any plan the Washington Department of Fish and Wildlife makes for wolf management, it must include: (1) Wolf - livestock conflict resolution, through education and nonlethal means, in some of the state's best habitat for wolves; and (2) Public education on wolves and the impact they have on erosion, wild herd health, varmint reduction, etc. This is emphasized in the current plan and should be carried out by your Department. Wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, must be science-based, taking into consideration the pack structure (alphas should not be killed). Use public rule-making processes that result in transparent, rational, and enforceable strategies to protect our wolf populations and the future of our natural environments. Therefore I urge you to: (1) Stop justifying wolf-killing when other alternatives exist; (2) Answer the global call by the public and scientists to protect and conserve apex predators, and thereby, our ecosystems; and (3) Use every opportunity to educate RE: the value of top predators in keeping nature healthy; immediately cease current messaging that prioritizes livestock over wolves. The department must get the message across that wolves are ecologically important and worth conserving and help the public to see many reasons to coexist with wolves.

Thank you for your consideration in this matter of paramount importance to the future of our forests.

Sincerely,

Robin Robin
Kailua, HI 96734

Washington Department of Fish and Wildlife

Bellingham, WA 98226

Washington Department of Fish and Wildlife

Once again I write to an agency that I believed was created to protect and preserve wildlife and wild habitats to ask you to please protect yet another species that is under threat. To attempt to create a "post-recovery" plan for wolves at this time is irresponsible considering that Washington state is still far from meeting the goals set forth in the current plan. Please find ecologically sound ways to address current wolf-management needs.

Wolves should not be arbitrarily slaughtered to satisfy ranchers' wishes. As I understand it, and possibly I'm wrong, your agency is not meant to protect the needs of ranchers or other groups whose interests go against wildlife and natural habitats. You are under no obligation to satisfy their wishes at the expense of wolves or other species.

Better public education regarding wolves hasn't been attempted from what I've read. Apparently it was an important part of your current plan, but has been ignored. Again, maybe I'm wrong, but from what I read, I don't think so.

I'm surprised that it's not a given that you would ensure that under the current plan for wolves - and any future plan - that all policies, laws and the enforcement of them would be based on scientifically proven information especially if you are considering the killing of wolves.

You don't need me to tell you that to wipe out wolves isn't going to be a good thing because it absolutely will have a detrimental effect on the balance of the ecosystem.

No species, especially an iconic species such as wolves, deserves to be threatened and purposely allowed to be misunderstood to satisfy special needs interests (such as ranchers). Creating a climate of hate at worst and fear at best is shameful, as is the wholesale selling out of a species in order for some people to make money.

I hope you will act quickly and decisively to protect wolves in Washington state.

Thank you for considering my comments.

Sincerely,

Krissa Krissa
Brooklyn, NY 11205

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time IS PREMATURE, AS Washington STILL FAR FROM MEETING THE GOALS SET FORTH IN THE CURRENT PLAN.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife MUST INSTEAD FOCUS ITS ATTENTION ON CURRENT WOLF-MANAGEMENT NEEDS. THIS INCLUDES: (1) RESOLVE, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) CONDUCTING EXTENSIVE public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — MUST BE DEVOLVED THROUGH a science-based, PUBLIC rule-making process THAT RESULTS IN transparent, rational and enforceable strategies. Therefore I STRONGLY REQUEST YOU TO: (1) STOP cherry-picking science to justify wolf-killing; (2) ANSWER the global call by scientists to TO PROTECT AND CONSERVE conserve apex predators; and (3) Use every opportunity TO EXTOL the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The PUBLIC will fail to see any reason to coexist with wolves if the department FAILS TO explain that WOLVES ARE ECOLOGICALLY IMPORTANT AND WORTH CONSERVING. Thank you for considering my comments.

Sincerely,

Mark Mark
Santa Rosa, CA 95401

Washington Department of Fish and Wildlife

I am a concerned American who cares about wildlife and the environment. One of the most eery and memorable moments in my life was visiting a wolf sanctuary in Pennsylvania and witnessing all the wolves howling at once. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. As your constituent my expectation is that you will follow through in good faith on building the state population of this endangered species, and educate the public to reduce potential conflicts and to keep them viable here.

Thank you for considering my comments.

Sincerely,

Jenny Jenny
Everett, WA 98208

Washington Department of Fish and Wildlife

All I read about Washington wolves is that the state wildlife agency has killed another one. This is horrible, a perverse method of wolf management, and it illustrates exactly why work still needs to be done on the RECOVERY of wolves in Washington.

It is not the time to claim victory and start planning for post-recovery, as there are still very few wolves in the state, and there are continual occurrences particularly in northeast Washington of lethal means being used against the few wolf packs that have taken up residence in the state. I believe that there is still a shoot first mentality in the state wildlife agency. Some recalcitrant ranchers have ideological opposition to wolves and ignore the benefits of non-lethal management of wolf/cattle conflict, such as range riders. Unfortunately the Washington wildlife agency kowtows to these individuals, rather than adhering to recovery plans and saying no to lethal actions.

This means recovery is not sustainable. Therefore, creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan for recovery of the wolf. I ask that the Washington Department of Fish and Wildlife focus your attention on meeting the current wolf-management needs. This must be done to stabilize the situation for wolves in Washington and the maintenance of sustainable populations for all times in all of the historical range of wolves. Therefore, I ask that the Department of Fish and Wildlife complete the following actions first, before contemplation of post-recovery planning. (1) There are demonstrated successful non-lethal methods of resolving conflicts between livestock and wolves. The Department must institute the use of non-lethal means in all areas, particularly in the problem areas in northeastern Washington, which is a region with some of the state’s best habitat for wolves. (2) Finish the plan you are operating under now, such as public education on wolves. This is emphasized in the current plan but has not been done. Public education is critical for achieving successful wolf recovery and population stabilization across its entire range.

(3) Develop a wolf management structure that is focused on achieving non-lethal means of control. This can and must be developed based upon the analysis of peer-reviewed scientific study. The management plan should be implemented using the public rule-making process that is transparent and rational. Therefore I urge you to: (1) Answer the global call by scientists to protect and conserve your apex predators, wolves and grizzlies. (2) Stop your current management focus that prioritizes livestock over wolves. Wolves are important to the balance of the natural systems, not the bad guys. (3) Let scientific analysis guide all management decision making, and reject the historical biases of those who will never see fit to try to reside peacefully with wolves, but who instead use their political influence to call for unnecessary and destructive killing of wolves.

Sincerely,

Bryan Bryan
Saint Paul, MN 55113

Washington Department of Fish and Wildlife

The citizens of Washington State expended considerable resources on recovering a viable population of wolves. And now, before the populations have gotten to the agreed upon population, well before, you are creating a "post recovery" plan? Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. These majestic animals add balance to the natural ecosystem and should be allowed to be a part of it. Thank you for considering my comments.

Sincerely,

June June
Pocatello, ID 83201

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Keep the cattle separate from the wildlife. Place the cows on ranchers property not the public lands. Stop the helicopter shooting of wolves and wildlife. Keep the salt licks only on ranches. Thank you for considering my comments.

Sincerely,

s s

Washington Department of Fish and Wildlife

I am a retired environmental scientist and I would dearly love to see wolves back on the Olympic peninsula. This part of Washington would be perfect for them, if they could get here. However, if they continue to be killed by the state over in the eastern reaches, we don't have a chance for seeing wolves here in my lifetime. It's a fact of life that we are overrun with deer in this part of the state. Having wolves back to fill that apex predator niche would be a smart way to address the issue- it would not only save human lives and property but would also enhance the ungulate population health.

Please consider the following comments regarding the Dept's plan to delist wolves in Washington state. First and most importantly, don't do it! It is far, far too soon... since its required by law for wolves to be present in all three recovery regions, and they are not present in western Washington, why would the Dept be considering implementing a plan that is categorically against current law? Secondly, the Department needs to reform its current approach on managing wolf conflict. You've killed wolves rather than tried to implement non-lethal means of controlling wolf-livestock conflict. This absolutely needs to stop.

Third, the Department needs to reform its philosophic approach to wolves in Washington state. This isn't the middle ages any more and the fears and myths associated with the Big Bad Wolf are far in our past. Our science has shown that predators such as wolves are critical components to ecosystem health. I believe the public knows this and the Department needs to demonstrate through its actions that it is acting in the interest of the entire state, and not just the livestock and game industries. Fourth, update your science in the Wolf Management Plan. It's been eight years, and to ignore what has been learned in those years is nothing less than incompetence. Fifth, implement a mandate that prohibits wolf killing on public land. For that matter, implement a mandate that prohibits the state of Washington to kill or trap wolves anywhere. Six, do not under any circumstance consider the wolf for designation as a game species! We need them to control the ungulates! This should be your mandate: (1) use a science-based, public rule-making process that results in transparent, rational and enforceable strategies, and (2) protect and conserve apex predators (they are needed). Thank you for considering my comments.

Sincerely,

Robin Robin

Washington Department of Fish and Wildlife

Wolves are a natural part of a healthy ecosystem. Ranchers who pay next to nothing to use our public lands for cattle grazing know the risks of doing and wolves should not be killed for being what they are. You are the Department of Fish and Wildlife, not the Department of Cattle. Please act accordingly. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Yelm, WA 98597

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. The fact that gray wolves have returned to Washington is a success story in itself, but the number of wolves and lack of sustaining measures in place show that the state is not ready to begin thinking about de-listing wolves.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Mr. Susewind , JT Austin and wildlife 'officials", Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Your agency has killed more than 30 wolves this fall and without having read all your ridiculous , arbitrary and monotonous regulations, even I understand that you simply are out to please ranchers. Particularly , Len MvIrvin. Your pie in the sky idea of changing pack behavior is asinine.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Predators like wolves are vital to a healthy ecosystem. Cattle and sheep are not. With 100 or so wolves in WA we should not be killing them. There are more options to be considered than shoot to kill.

Thank you for considering my comments.

Sincerely,

Andrea Andrea
Olympia, WA 98516

Washington Department of Fish and Wildlife

We have watched the work of Conservation Northwest in promoting co-existence between wolves and public lands ranchers in Washington. They've been doing a great job and have had significant success. Any plan for wolf "management" must meet with the approval of Conservation Northwest. We need to hear that they have been consulted and approve of the final product. Any plan must give precedence to the needs of wolves. Its their habitat. The ranchers and their activities have been imposed on the wolves' habitat and it is for the ranchers to change their behavior rather than to evict/exterminate the wolves. Luckily, we have Conservation Northwest and their programs to help those ranchers change their behavior.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

My name is Catherine Frizat, I am writing regarding the proposal to create a "post recovery" wolf management plan in Washington.

I am a citizen who values nature and wild places, and for whom the protection of the environment and its biodiversity matters above all other current political issues. If humans are to survive as a species, we must stop our destructive path and re-learn to live in harmony with nature and all other animal species. Our natural spaces and wilderness areas have been severely impacted by the absence of wolves for too long. While they are slowly making a comeback, the existence of these apex predators is still fragile and we must take all necessary steps to ensure their survival as an essential species.

Consequently I believe that the establishment of this plan is entirely premature. Washington is still far from meeting the current plan's goals. There are no wolves in the 3rd zone, annual population growth is stagnating, and the number of wolves per pack is small. Instead of rushing to create a post-delisting plan, the Washington Department of Fish and Wildlife must concentrate on current wolf-management needs. This includes: (1) Implementing non lethal solutions to resolve conflicts between livestock and wolves as requested by Governor Inslee and (2) Increasing public education on wolves. This is outlined in the current plan but nothing has been done in that respect, even though all wolf experts say public education is absolutely essential for successful wolf conservation.

In addition, for the current plan and for any future wolf plan, management policies must be established through a science-based, public rule-making process. Therefore I am asking you to: - Respect and answer the global call by scientists to protect and conserve apex predators - Reject any initiative that prioritizes livestock over wolves - Reject any requests for state sanctioned hunting or trapping season on wolves, and any requests for designating the species as game mammals - Recognize that the state holds wolves in trust for the public Thank you for considering my comments.

Sincerely,

Catherine Catherine

Please help the wolves to reach recovery. We have worked so many years to help this apex predator make a come back. Their role is vital! Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Please help to develop a plan that will succeed for the wolf recovery! Thank you for considering my comments.

Sincerely,

Dawn Dawn

Washington Department of Fish and Wildlife

Wolves are an apex species. Do not sell them out for commercial ranching. Livestock moved into their habitat, not the other way around. Protect the wolves. Develop alternatives that allow them to thrive. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Mm Mm
Saint Louis, MO 63119

Washington Department of Fish and Wildlife

It is too soon to create a “post-recovery” plan for wolves! Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must focus its attention on current wolf-management needs, including: (1) Resolving conflicts between livestock and wolves WITHOUT harming either; (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Emily Emily
San Francisco, CA 94114

Washington Department of Fish and Wildlife

My name is Emma and I've been studying the mythology of wolves for the past few years. They are one of the most misunderstood and illogically maligned species on this planet and it's far past time humans actually spent some time trying to work with them rather than just assuming all wolves are like the ones in the fairytales.

As per this issue, I will say that creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Washington Department of Fish and Wildlife

I have been waiting for as long as I've lived in Washington to see or even just hear a wolf. Now, it seems, they're being controlled by killing them. Please put your heads together and figure out a solution to the very natural cattle predation that doesn't involve destroying these amazing animals. We're the invaders, not them.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. Washington Department of Fish and Wildlife

Wolves are a keystone species for many areas in the United States, and they are necessary to keep prey populations like Elk and Deer down so that they do not overgraze on trees and brush. Please focus on wolf recovery and conservation as they are essential to the ecosystem of many forests and National Parks.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. The following boilerplate from the CENTER for BIOLOGICAL DIVERSITY makes many good points with which I agree. Add to that, top tier predators (e.g., wolves) are necessary to maintain the balance of nature. Without them, herbivores overgraze and thereby alter the ecosystem. Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Washington Department of Fish and Wildlife

I am a private citizen with a medical/science background. Evidence based practices are important to me. I hope that you feel the same as you have a very important job and a responsibility to the taxpayers of the State of Washington. All of us are depending on you to gather and interpret information in an unbiased fashion and with no political agendas. Thus far it is pretty clear that your wolf management group has not been successful in achieving this mandate and that a small group with a vested interest in this matter is managing the managers.

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments. Please try to do better. The citizens of this state are deserving of your best efforts and continuing your current practices is unacceptable to a growing number of us.

Sincerely,

Mary Mary
Vashon, WA 98070

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves, for example Conservation Northwest's Range Rider program; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Also, ranchers who consistently demand that wolves be killed should be required to begin using non lethal means before resorting to the destruction of wolves that they blame for livestock death.

Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Janis Janis

Washington Department of Fish and Wildlife

As a former resident of the PNW, I am saddened that Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop manipulating science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to explain the value of top predators in keeping nature healthy, and end the current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Lisa Lisa
Hot Springs National Park, AR 71913

Washington Department of Fish and Wildlife

As a Washington resident, I am appalled that my state continues with antiquated wildlife policies regarding wolf reintroduction.

I'm also appalled that state taxes are used to kill wolves. We spend federal taxes to reintroduce wolves, then spend state taxes to have them killed. That makes no sense. Seems to make much more sense to spend money to relocate them and to compensate ranchers fully for their losses.

Creating a "post-recovery" plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Laura Laura

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Cherie Cherie
Camas, WA 98607

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Steve C. Steve C.
Columbia, SC 29223

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Linda Linda

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Amy Amy

This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Lynn Lynn
Milledgeville, GA 31061

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Jeanine Jeanine
Novato, CA 94949

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Dennis Dennis

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Nancy Nancy
Libby, MT 59923

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Mount Vernon, WA 98273

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Ernesto Ernesto

This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Teresa Teresa
Murfreesboro, TN 37129

Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. Washington Department of Fish and Wildlife

Creating a “post-recovery” plan for wolves at this time is premature, as Washington is still far from meeting the goals set forth in the current plan. Instead of racing to create a post-delisting plan, the Washington Department of Fish and Wildlife must instead focus its attention on current wolf-management needs. This includes: (1) Resolving, through nonlethal means, conflicts between livestock and wolves, which are taking place in some of the state's best habitat for wolves; and (2) Conducting extensive public education on wolves. This is emphasized in the current plan but has not been done by you, despite the fact that all wolf experts say public education is the single most important action to take for successful wolf conservation.

Additionally, under the current wolf plan and any future wolf plan, management guidance, policies and protocols — and especially those which could result in wolves being killed — must be developed through a science-based, public rule-making process that results in transparent, rational and enforceable strategies. Therefore I urge you to: (1) Stop cherry-picking science to justify wolf-killing; (2) Answer the global call by scientists to protect and conserve apex predators; and (3) Use every opportunity to extol the value of top predators in keeping nature healthy, and cease current messaging that prioritizes livestock over wolves. The public will fail to see any reason to coexist with wolves if the department fails to explain that wolves are ecologically important and worth conserving. Thank you for considering my comments.

Sincerely,

Charlene Charlene
