Current science developed over the last 25 years based on studies in many different echo systems around the world have identified several KEYSTONE species that hold, or help to hold together, the entire region in which they live.

WOLVES ARE SUCH A KEYSTONE SPECIES upon which all other forms of life in their range depend. They prevent the overpopulation of grazing/browsing animals. This allows the trees and vegetation to thrive. This provides habitat for birds and other creatures that depend upon vegetation and trees and including waterways. Trees shade waterways and provide nutrients and moderate water temperature so fish can flourish.

We should stop deciding what is 'best' for nature, stop over-managing and disturbing systems that have thrived for eons before humans were here.

HEY! PEOPLE! LET THOSE WOLVES ALONE!!!
