

Michael Lemes

Wolves are essential to the recovery of ecosystems on Earth. Wolves are a corner stone species that impacts from the smallest insect to other predators within ecosystem. It is proven by science and the reintroduction of wolves in Yellowstone. Wolves are responsible for trophic cascades and they do not need to be hunted to be culled they are so in balance with nature that their numbers are in harmony and only have as many wolves as the ecosystem can support. Without wolves humans will destroy the planet and ourselves. They are essential to life on Earth.
