

Raw Milk and Threats to Human Consumer Health

The consumption of raw milk raises the risk for humans to contract an illness-causing microorganism (primarily pathogenic strains of bacteria). Much evidence (refer to <https://www.marlerblog.com/?s=raw+milk> for specific outbreak cases) supports the ongoing concern to humans (including children) that this is a real and constant threat. Additionally, lawsuits typically occur for the injured to recoup hospital expenses when surviving from pathogenic bacterium and may result in bankruptcy for the raw milk producers.
