

Anna Godduhn

Hello and good day,

I write to object to the permitting of micro-nuclear reactors. Alaska needs to focus on self-reliance while reducing our energy consumption and our costs. We need to build our own windmills and lead the development of less impactful ways to capture tidal and fluvial energy. The idea that we should invest in experimental mini-reactors, the creation of which requires the ongoing extraction of uranium and petroleum – for 10 years of energy and a peppering of mini-toxic waste plants that will burden generations with maintenance and a legacy of carcinogenic and mutagenic material. How is this any solution at all?
