

Guido Nunez-Mujica

Alaska is the 5th state in terms of carbon emissions. The average Alaskan generates 3 times as much CO2 as other Americans. At the same time, Alaskans are more vulnerable to climate change and have less sunlight for their power needs.

Alaska is a great fit for SMRs. Emissions need to be reduced, sunlight is scarce and there is a huge necessity of energy for heating. Alaskans should be able to have access to affordable, clean electricity that doesn't generate carbon, and SMRs are the way to go.

The safety record of nuclear submarines in the US Navy is impeccable and inspires hope and confidence. As a patriot and a believer in the ingenuity of Americans, I am looking forward to see SMRs built in Alaska.
