

Marshall Clymer

There is absolutely no credible evidence that the latest incarnation of nuclear reactors being called "micro-nukes" is any safer than the nuclear reactors of the past -- and quite a bit of evidence that they are just as dangerous, if not more so. The idea of putting unattended micro-nukes in rural areas of Alaska is beyond comprehension, given the growing threat posed by terrorism. There are better ways to address high energy costs in rural Alaska and transition Alaska beyond fossil fuels. Just say "NO" to micro-nukes.
