

Kurtis Duncan

I am in support of microreactors! They are a critical step in the future of green fuel. They will become a critical part of the green energy mix in the future - more reliable than wind and solar, so can provide reliable energy in the extremely variable climates known around Alaska. Pilot programs like this one will be extremely beneficial for proving out the technology so that more remote regions can have clean, reliable, and economically affordable power. Not only is this technology good for Alaska, it is good for the future of humanity.
