

## Dylan Jones

Microreactors are an unacceptable method of energy production. They contaminate the environment, posing human and animal health risks for the million years it takes toxic waste to safely degrade. Most importantly, microreactors continue the genocidal relationship between the United States and indigenous peoples whose lands, waters, and bodies nuclear mining and development disproportionately contaminates without any semblance of recognition for indigenous sovereignty. The United States military is the largest climate polluter in history. Microreactors are only a means of toxic energy production for an institution that will use that energy to further contaminate and pollute the environment globally and drive climate change forward.
