

# Alaska Hydro Power

As the owner of a renewable energy utilities company, focused on patenting and manufacturing devices that harness wave and tidal energy, I can say whole heartedly say that these micro-reactors are some of the most remarkable renewable energy devices every created! It is technology like this that will get humanity off fossil fuel and Alaska can be the leading example for the country or even the world.

Please disclose all operations of the reactors (are they thorium reactors?) Also once regulation is established please include the option for individuals and private businesses to be able to apply and go through the process to implement the technology if they can meet all the requirements. Please don't make the requirements something that only a military or government subsidy can afford. Be diligent with the review and make the application process very in depth, but make it cheap and affordable because the residents and businesses who do want to pursue the application will eventually have to spend large amounts to build the reactor and accompanying facilities to meet all the requirements. This has the potential to create a whole new industry that will stimulate and grow the state in ways that can't be imagined now. 100% support.
