Re: Micro nuclear reactor energy production in Alaska—

1. What safeguards would be in place in the event of sabotage?
2. What safeguards would be in place in the event of a large seismic event, (earthquake)?
3. How & where would nuclear waste be stored?
4. What is the rationale for building these reactors, given the fact that they wouldn't come online for several years, while renewable energy technology, (solar, wind, tidal & geothermal) is making consistent and significant annual advances, and should be able provide more than half of Alaska's electric needs within 10 years, (provided the state of Alaska makes the right choices).

NO nuclear energy reactors in Alaska! We have too much to lose.
