	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]	NAAQS Modeling. The dispersion model establishes permit limits on PM_{10} and $PM_{2.5}$ emissions such that ambient concentrations remain below NAAQS thresholds. Requirements include use of control equipment, minimum transfer efficiency, maintenance of dispersion characteristics, daily coating usage recordkeeping, and daily compliance calculations. The daily calculations are required because the PM_{10} and $PM_{2.5}$ are 24-hour standards.
COMG 5 (Permanent Total Enclosure Requirements: Coating Rooms)	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	Coating Room Pressure Drop. Operation maintenance of each coating room such that it remains a permanent total enclosure, and that the minimum pressure drop remains below the limit established in the permit, to ensure all coating emissions vent to STRU 73 as characterized by the AERA.
	Minn. R. 7007.0800, subp. 2(A) & (B)	Coating Room Pressure Drop Continuous Monitoring Device. Installation, operation, and maintenance of a pressure drop monitoring device to monitor the pressure drop across each coating room enclosure.

Subject item*	Applicable regulations	Rationale
		Coating Room Pressure Alarm. Installation, operation, and maintenance of an alarm that triggers when the pressure drop limit of any coating room is exceeded.
		Weekly Reporting. Reports of deviations from the required pressure drop limit must be reported weekly.
		Retro-Coat Vapor Intrusion System. Coating room floors where t-DCE VOC coaters operate are required to be coated in order to minimize vapor intrusion into concrete surfaces.
		Retro-Coat Vapor Intrusion System Inspections. Requirement for daily inspection of coating room floors where t-DCE VOC coaters operate for degradation, including recordkeeping and reporting.
	Minn. R. 7017.2005 – 7017.2025	Performance testing within 30 days of permit issuance and annually thereafter to ensure the system operates as a total enclosure.
COMG 6 (Indirect Heating Equipment Rule Requirements))	Minn. R. 7011.0515	Standards of Performance for New Indirect Heating Equipment. • Construction of the unit was on or after January 31, 1977; • The unit burns gaseous fuels; • The facility is located inside the cities in Table II of the rule; • The facility has less than or equal 250 MMBtu/hr of indirect heating equipment.
COMG 7 (Industrial Process Equipment Rule)	Minn. R. 7011.0715	Standards of Performance for post-1969 Industrial Process Equipment. Equipment for which there is no other promulgated performance standard is subject to the opacity and PM limits in this rule. Construction of the unit was on or after July 9, 1969.
COMG 8 (PM10 and PM2.5: Limits and Compliance Requirements for Water-Based Spray Battery Terminal Post Coaters)	40 CFR § 52.21(b)(1)(i)	Prevention of Significant Deterioration (PSD). Limits taken to avoid major source under PSD for VOC emissions. Requirement requires to comply with requirements in COMG 1
	40 CFR § 70.2	Limits to avoid Part 70. The use of control equipment complying with COMG 14 is needed to maintain the PM_{10} and $PM_{2.5}$ emissions at less than Part 70 thresholds. Other requirements include compliance calculations, and recordkeeping.
	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	NAAQS Modeling. The dispersion model establishes permit limits on PM_{10} and $PM_{2.5}$ such that ambient concentrations remain below applicable NAAQS. Requirements include use of control equipment, minimum transfer efficiency, maintenance of dispersion characteristics, coating usage recordkeeping and compliance calculations.

Commented [A14]: The facility is not subject to 40 CFR 63 subp. MMMM and should not be required to meet the standards of that NESHAP. Annual testing of the total enclosure should be replaced with testing every five years.

Subject item*	Applicable regulations	Rationale
COMG 9 (Sub-Slab Vapor Remediation System: Operation Requirements)	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	Air Emissions Risk Analysis (AERA). Controlled and uncontrolled emissions from sub-slab vapor remediation system operation required by the Stipulation Agreement were characterized by the AERA. The permit requires operation and maintenance of the sub-slab vapor remediation system and control equipment in accordance with the MPCA Remediation Division's requirements. The permit defines an alternative uncontrolled emission rate as a point of reference for future analysis. The permit authorizes the removal of the activated carbon canisters with written approval from the MPCA Remediation Division.
COMG 10 (NOx: North Building Space Heating Capacity Limits)	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	NAAQS Modeling and AERA. The permit limits the total heat input from space heaters as well as the months of operation to what was assumed in the dispersion model. The permit requires the facility to maintain an inventory of combustion units at the facility as well as daily records of operation.
COMG 11 (Mist Eliminator/HEPA Filter and Electrostatic Precipitator Control Equipment Train – Melt Pots)	40 CFR § 70.2	Limits to Avoid Part 70. Control efficiency and other operating requirements to limit $PM_{10}/PM_{2.5}$ potential to emit to below Part 70 thresholds. Limits reflect that the units have total enclosures connecting to control equipment. Permit specifies that replacement HEPA filters must meet the COMG 11 requirements.
	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	NAAQS Modeling and AERA. The permit requires the emissions from melting pots to be controlled by pollution control equipment meeting the conditions in COMG 11. The permit requires installation, operation, and maintenance of control equipment at the minimum overall control efficiency assumed in the dispersion model.
COMG 12 (Mist Eliminator/HEPA Filter and Electrostatic Precipitator Control Equipment Train – Die Casting)	40 CFR § 70.2	Limits to Avoid Part 70. Control efficiency and other operating requirements to limit $PM_{10}/PM_{2.5}$ potential to emit to below Part 70 thresholds. Limits reflect that the units have total enclosures. Permit specifies that replacement HEPA filters must meet the COMG 12 requirements.
	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	NAAQS Modeling and AERA. The permit requires the emissions from die casting units to be controlled by pollution control equipment meeting the conditions in COMG 12. The permit requires installation, operation, and maintenance of control equipment at the minimum overall control efficiency assumed in the dispersion model.
COMG 13 (Direct Heating Equipment Rule Requirements)	Minn. R. 7011.0610	Standards of Performance for Direct Heating Equipment. • Construction of the units was on or after July 9, 1969; • The units burn gaseous fuels; • The facility is located in the Twin Cities; and • The facility has less than or equal 250 MMBtu/hr of direct heating equipment.
COMG 14 (HEPA Filters – Spray Coaters)	40 CFR § 70.2	Limits to Avoid Part 70. Control efficiency and other operating requirements to limit $PM_{10}/PM_{2.5}$ potential to emit to below Part 70 thresholds. Limits reflect that the units have total enclosures connecting to control equipment. Permit specifies that replacement HEPA filters must meet the COMG 14 requirements.

Subject item*	Applicable regulations	Rationale
	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	NAAQS Modeling and AERA. The permit requires installation, operation, and maintenance of control equipment at the minimum overall control efficiency assumed in the dispersion model.
COMG 15 (NOx: South Building Space Heating Capacity Limits)	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	NAAQS Modeling and AERA. The permit limits the total heat input from space heaters as well as the months of operation to what was assumed in the dispersion model. The permit requires the facility to maintain an inventory of combustion units at the facility as well as daily records of operation.
COMG 16 (Die Casting Annual Throughput and Lead Emission Limits)	Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)	NAAQS Modeling and AERA. The permit limits the total process throughput and annual lead emissions from die casting units to what was assumed in the dispersion model. The permit requires the facility to calculate and maintain records of process throughput of lead-containing material and annual lead emissions as a 365-day rolling sum.

3. Technical information

3.1 Calculations of potential to emit

- **Battery terminal post coaters**

  Unrestricted potential to emit

  Emissions from battery terminal post coaters (coaters) are mainly VOCs but also include PM/ PM_{10}/ $PM_{2.5}$from coaters that use spray applications. The specific VOC being regulated as an air toxic is t-DCE, and it is conservatively assumed that all VOC in t-DCE VOC coatings is t-DCE. The reason for this conservative assumption is because the exact content of t-DCE in the VOC coatings was certified as not public data by MPCA on January 25, 2019. In order to show compliance with permit limits, the data to be used must be public as it is considered emission's data as defined at in 40 CFR 2.301(a)(2)(i). Therefore, the only data that can be used for determining compliance with t-DCE limitations is the VOC content of coating material which has been disclosed as public data. The VOC content is a conservative estimate of t-DCE because there are other VOCs in the VOC coating formulations. Unrestricted VOC emissions were calculated through a mass balance approach using the maximum coating capacity of the coater and the maximum VOC content (weight fraction) of each coating specified by their respective safety data sheet (SDS), laboratory analysis (water-based coating), or ASTM testing method (UV coating). VOC content below detection level was conservatively assumed to be present at minimum detection levels (MDL). Therefore, maximum potential to emit for VOCs was calculated, in pounds per hour (lb/hr) and tons per year (ton/yr), as follows:

  Maximum Hourly VOC Emissions (lb/hr) = [Maximum Coating Application Rate (lb/hr)] x [Maximum VOC Content of Coating (wt. %)]

  Maximum Annual Emissions of VOC (ton/yr) = [Maximum Hourly Emissions (lb/hr)] x [24 hour/day] x [365 day/year] / [2000 lb/ton]

  Similarly, the potential to emit for PM/PM_{10}/$PM_{2.5}$from coaters using a spray application is also calculated though a mass balance approach using the coater's maximum coating application rate, the maximum solids content of any coating used at the facility, and, for t-DCE VOC and water-based coatings, the minimum transfer efficiency of the spray gun. The minimum spray gun transfer efficiency for t-DCE VOC and water-based coatings was reported as 65 percent, consistent with EPA guidance for a low volume, low pressure (LVLP) spray guns. Since no specific transfer efficiency was available for the UV coating spray nozzles, the facility was required to conduct a performance test to determine PM/PM_{10}/$PM_{2.5}$emission factors under Permit No. 12300341-004. Therefore, maximum potential to emit for PM/PM_{10}/$PM_{2.5}$from spray t-DCE VOC and water-based coaters are calculated as follows:

  Maximum Hourly Emissions of PM/PM_{10}/$PM_{2.5}$ (lb/hr) = [Maximum Coating Application Rate (lb/hr)] x [Maximum Solids Content in Coating (wt. %)] x [1- Transfer efficiency (fraction)]

  Maximum Annual Emissions of PM/PM_{10}/$PM_{2.5}$ (tpy) = [Maximum Hourly Emissions (lb/hr)] x [24 hour/day] x [365 day/year] / [2000 lb/ton]

  The emission factors resulting from the UV coater performance test performed on June 22, 2021, were determined and will be used in emissions calculations until the next performance test as follows*:*

  Maximum Hourly Emissions of PM/ PM_{10}*/$PM_{2.5}$ (lb/hr) = [Maximum Coating Application Rate (lb/hr)] x [PM/PM_{10}/$PM_{2.5}$Emission Factor (lb/lb)]*

Maximum Annual Emissions of PM/PM_{10}/$PM_{2.5}$ (tpy) = [Maximum Hourly Emissions (lb/hr)] x [24 hour/day] x [365 day/year] / [2000 lb/ton]

Using the solid content in each coating, it was assumed that PM_{10} and $PM_{2.5}$emissions are each equal to PM emissions. Although this approach is conservative for filterable PM/PM_{10}/$PM_{2.5}$and does not account for possible formation of condensable PM aerosols, compliance determinations will require assessment of condensable particulates to ensure compliance. The maximum coater capacity, VOC solvent, water-based coating VOC content, UV coating VOC content, coating solids content, UV coating emission factors at the time of permit issuance, and minimum spray gun transfer efficiency allowed by the permit are listed in Appendix B to the permit.

Commented [A17]: There is no explanation for how this compliance demonstration would be completed. Water Gremlin reserves further comment.

Limited potential to emit

Unlike unrestricted PTE, limited PTE calculations take into account federally-enforceable limits or operation restrictions. Therefore, limited emissions may be calculated by taking into account permit limits, including but not limited to emission limits, coating usage limits, VOC and solids content limits, limits on hours of operation, minimum transfer efficiencies, and capture and control efficiencies on pollution control equipment. For emissions from battery terminal post coaters, the permit has federally-enforceable limits on VOC and PM/PM_{10}/$PM_{2.5}$emissions that may not be exceeded and also includes compliance demonstration conditions (Section 3.3). The permit has state-only enforceable limits on t-DCE emissions that may not be exceeded and also includes compliance demonstration conditions (Section 3.3). Therefore, the facility's limited PTE for these pollutants is equal to the permit limit.

- **t-DCE emissions outside coating rooms**

Emissions of t-DCE inside the facility building but outside of coating rooms, including the chemical storage room, were calculated using measured indoor air concentrations of the pollutant. This separate accounting was included because the t-DCE solvent usage requirements measure what is used in the VOC coating room and there are minor but measurable sources of t-DCE solvent evaporation outside coating rooms. Due to the large amount of data available, a 95 percent upper confidence limit (UCL)was calculated using one full year of indoor air sampling data. The upper bound of the 95 percent UCL was used to represent the highest indoor t-DCE concentration at any given time. For non-coating rooms other than the chemical storage room, the total daily contribution was determined to be insignificant when compared to the facility's permit limit. Indoor air t-DCE concentrations in the chemical storage room were deemed significant enough to be required to be included in daily t-DCE calculations. The daily t-DCE emissions from the chemical storage room are calculated as follows:

Commented [A18]: Therefore, the non-coating room value in Appendix B should be deleted.

t-DCE Emissions Outside Coating Rooms (ton/day) = [Measured t-DCE concentration (ug/m3)] x [Chemical storage room ventilation rate (ft3/min)] / [35.31 ft3/m3] x [60 min/hr] x [g/1,000,000 ug] / [453.6 g/lb] x [2000 lb/ton] x [60 min/hr] x [24 hr/day]

- **Lead processing units**

Unrestricted potential to emit

Emissions from lead melt pots, die casting units, and billet saws include lead, PM, PM_{10}, and $PM_{2.5}$ (PM_{10} and $PM_{2.5}$emissions were conservatively assumed to be equal to each other). Emissions are calculated through a mass balance approach using the maximum hourly lead-containing material throughput and the uncontrolled emission factor described later in this section. Therefore, maximum unrestricted PTE for lead, PM, PM_{10}, and $PM_{2.5}$is calculated as follows:

Maximum Uncontrolled Hourly Emissions of Lead (lb/hr) = [Maximum Hourly Process Throughput (lb/hr)] x [Uncontrolled Emission Factor (lb lead/lb lead-containing material)]

Maximum Uncontrolled Annual Emissions of Lead (ton/year) = [Maximum Uncontrolled Hourly Emissions of Lead (lb/hr)] x [24 hour/day] x [365 day/year] / [2000 lb/ton]

Maximum Uncontrolled Hourly Emissions of PM (lb/hr) = [Maximum Hourly Process Throughput (lb/hr)] x [Uncontrolled Emission Factor (lb PM/lb lead-containing material)]

Maximum Uncontrolled Annual Emissions of PM (ton/year) = [Maximum Uncontrolled Hourly Emissions of PM (lb/hr)] x [24 hour/day] x [365 day/year] / [2000 lb/ton]

Maximum Uncontrolled Hourly Emissions of PM_{10} (lb/hr) = [Maximum Hourly Process Throughput (lb/hr)] x [Uncontrolled Emission Factor (lb PM_{10}/lb Lead-containing material)]

Maximum Uncontrolled Annual Emissions of PM_{10} (ton/year) = [Maximum Uncontrolled Hourly Emissions of PM_{10} (lb/hr)] x [24 hour/day] x [365 day/year] / [2000 lb/ton]

Maximum Uncontrolled Hourly Emissions of $PM_{2.5}$(lb/hr) = [Maximum Hourly Process Throughput (lb/hr)] x [Uncontrolled Emission Factor (lb $PM_{2.5}$/lb Lead-containing material)]

Maximum Uncontrolled Annual Emissions of $PM_{2.5}$ (ton/year) = [Maximum Uncontrolled Hourly Emissions of $PM_{2.5}$(lb/hr)] x [24 hour/day] x [365 day/year] / [2000 lb/ton]

Unrestricted PTE is required to be calculated in order to determine program applicability, such as PSD and Part 70, and if additional limits are required to remain below these programs and other standards (i.e., Industrial Process Equipment Rule). Since none of the casting units had a material throughput certified by the manufacturer, the facility was asked to estimate each casting unit's maximum short-term throughput. This was done by weighing each unit of lead-containing material loaded into the casting unit ("shot") and estimating the number of "shots" per eight-hour shift for that casting unit to obtain the maximum short-term throughput, in tons per hour, for each casting unit. The resulting throughputs were used in the equations above to obtain unrestricted potential to emit for each casting unit and billet saw. Spreadsheets in Attachment 1 to this TSD contains detailed calculations showing how short-term throughputs were derived.

Limited potential to emit

Unlike unrestricted PTE, limited PTE calculations take into account federally enforceable emission limits or operation restrictions. Therefore, limited emissions may be calculated by taking into account permit limits, including but not limited to emission limits, material throughput limits, limits on hours of operation, approved emission factors and/or minimum control efficiencies on pollution control equipment. For lead and PM/PM_{10}/$PM_{2.5}$emissions from lead processing units, the permit has federally-enforceable limits on lead and PM/PM_{10}/$PM_{2.5}$emissions, including compliance demonstrations (Section 3.3), that may not be exceeded; therefore, the facility's limited PTE from these units are equal to their respective permit limits.

Uncontrolled emission factors

Uncontrolled emission factors for PM, PM_{10}, and $PM_{2.5}$were derived from a June 2021 performance test of a Nederman filter and Smog Hog control equipment train. Recurring performance testing on an annual basis of select control equipment trains are required by the permit to verify emission factors, overall control efficiency, and compliance with stack emission limits (Section 3.4)

Commented [A19]: Annual performance testing is excessive and unnecessary. Inspections are required under the permit. Water Gremlin otherwise recommends following the manufacturer's recommendations.

Controlled emission factors

Controlled emission factors for captured lead emissions were derived from a stack test conducted in November 2018. The stack test measured emission rates from one of each Smog Hog configuration,

including single pass and double pass. Some emission factors are being extrapolated to representative emission units and associated control equipment as not all emission units or control equipment were tested. Since outlet emission rates were measured as pure lead, controlled emission factors for lead were obtained by first converting the lead-containing material throughput to pure lead throughput as follows:

Lead Throughput (lb/hr) = [Hourly Lead-Containing Material Throughput during Test (lb/hr)] x [Lead Content of Lead-Containing Material (lb lead/lb lead-containing material)]

The average hourly lead-containing material throughput was obtained by averaging the total lead-containing material throughput for the three test runs conducted. The maximum lead content of the lead-containing material was calculated as follows:

Lead Content of Lead-Containing Material (%) = [100%] – [Total Non-Lead Metal Content (%)]

The total non-lead content was obtained from the material specification sheet required by the facility. From this, the calculated lead content for each lead-containing material used at the facility ranged from 95 to 99.98 percent. With the lead content known, the controlled emission factor for lead may be calculated as follows:

Controlled Emission Factor for Lead (lb lead/lb lead-containing material) = [Average Hourly Lead Emissions at Test Outlet (lb lead/hr)] / [Lead-Containing Material Throughput (lb lead-containing material/hr)]

A maximum lead content of lead-containing material of 95 percent was used and is the maximum allowable in lead emissions calculations. As shown in the equations above, a lower lead content produces a lower lead-containing material throughput and, therefore, a higher controlled emission factor for lead. The higher controlled emission factor will produce higher calculated lead emissions for any given lead-containing material throughput, thus providing a more conservative estimation of emissions.

Uncaptured and captured emissions

During the die casting process, emissions escape the equipment casing before being vented to control equipment (uncaptured emissions). Therefore, the relative amount of emissions escaping in this manner had to be estimated. Compilation of Air Pollutant Emission Factors (AP-42), Chapter 12.11 Secondary Lead Processing describes this phenomenon and estimates that five percent of total uncontrolled emissions escape capture. Therefore, for modeling purposes, uncaptured PM/PM_{10}/$PM_{2.5}$and lead was estimated using known throughputs and emission factors from performance testing. Since these emissions are not captured by control equipment, it was assumed that all uncaptured emissions were emitted from the nearest building vent. The permit specifies to which vent uncaptured emissions from each unit must be vented. The permit also specifies that all other emissions (captured) must vent to control equipment whenever in operation. For other lead emission units, such as melt pots, the permit requires a total enclosure in which all emissions must vent. Therefore, no uncaptured emissions needed to be estimated.

- **Abrasive blasting**

  Unrestricted potential to emit

  Unrestricted particulate emissions from abrasive blasting operations were calculated using maximum flow rates, material densities, and emission factors from STAPPA/ALAPCO Abrasive Blasting guidance (5/91). The emissions calculations assumed each manual abrasive blasting unit utilizes one spray gun with a 0.25-inch diameter tip size at a maximum pressure of 90 pounds per square inch (psi) using glass

beads as abrasive media. From the spray gun tip diameter and pressure, the sand flow rate was determined from the chart provided in the STAPPA/ALAPCO Abrasive Blasting Guidance. Due to the density difference between sand and glass beads, the flow rate of sand obtained from the chart had to be corrected for the flow rate of glass bead media, as follows:

Flow Rate of Glass Beads (lb glass/hr) = [Flow Rate of Sand (lb sand/hr)] x [(Density of Glass Beads (lb glass/ft3)) / (Density of Sand (lb sand/ft3))]

After finding the true flow rate of the abrasive (glass beads), the unrestricted hourly and annual emissions from abrasive blasting units may be calculated as follows:

Unrestricted Hourly Emissions of PM/PM_{10}/$PM_{2.5}$(lb/hr) = [Maximum Abrasive Flow Rate (lb abrasive/hr)] x [Emission Factor (lb pollutant/lb abrasive)]

Unrestricted Annual Emissions of PM/PM_{10}/$PM_{2.5}$ (ton/yr) = [Unrestricted Hourly Emissions of PM/PM_{10}/$PM_{2.5}$ *(lb/hr)] x [8760 hr/yr] / [2000 lb/ton]*

It was assumed that PM_{10} and $PM_{2.5}$emissions are each equal to PM emissions to obtain a conservative result.

Limited potential to emit

Limited hourly and annual emissions from abrasive blasting are calculated using control efficiencies provided by HEPA filtration (Section 3.2) and is obtained as follows:

Maximum Controlled Hourly Emissions of PM/PM_{10}/$PM_{2.5}$ (lb/hr) = [Maximum Abrasive Flow Rate (lb abrasive/hr)] x [1 – Control Efficiency (fraction)]

Maximum Controlled Annual Emissions of PM/PM_{10}/$PM_{2.5}$ (ton/yr) = [Maximum Controlled Hourly Emissions of PM/PM_{10}/$PM_{2.5}$ (lb/hr)] x [8760 hr/yr] / [2000 lb/ton]

Lead emissions

Abrasive blasting is primarily used to remove metal residues from die casting tools, specifically lead residue. As a result, in addition to calculating PM/PM_{10}/$PM_{2.5}$emissions from these units, lead emissions were also estimated using the same calculation methods given above. A lead emission factor, in pounds of lead emitted per pound of abrasive blasted, was derived from the Background Document in AP-42 Chapter 13.2.6, Tables 4 and 5, conservatively assuming that the lead covers 100 percent of the tool surface and that the composition of the residue is 100 percent lead.

Compliance demonstration

Controlled emissions from abrasive blasting EQUI 113 and 114 vent to a common stack STRU 57. EQUI 113 and 114 were modeled assuming controlled emission rates. There are no daily calculations of emissions because these were modeled at rated capacity but there are requirements to test emissions at STRU 57 to verify compliance with emission limits.

The DC abrasive blasting EQUI 115 shares stacks (STRU 43 and STRU 50) that have an enforceable emission limit with associated compliance demonstration by means of daily emission calculations at STRU 43 and 50. EQUI 115 was modeled at rated capacity for all pollutants.

Uncaptured emissions from EQUI 124 (die casting unit), which shares STRU 43 with EQUI 115 emissions and two makeup air units (EQUI 106 and EQUI 109), is required to show compliance with applicable emission limits by means of daily calculations because it was not modeled at design capacity. The

contribution from EQUIs 106, 109, and 115 unrestricted potentials to emit were added to the calculation to demonstrate compliance with from the modeled emission rate for $PM_{10}$and $PM_{2.5}$. Only the contribution from EQUIs 115 unrestricted potential to emit was added to the calculation to demonstrate compliance with from the modeled emission rate for lead NAAQS at STRU 43 because the lead emissions from EQUIs 106 and 109 are orders of magnitude lower. The die cast units are subject to a facility-wide limit on a 365-rolling sum basis. Since EQUI 115 was modeled at rated capacity, the 365-day rolling sum of lead emissions at STRU 43 were not included as this will count towards the facility-wide cap on annual lead emissions from die cast.

Likewise, uncaptured emissions from EQUI 125 and EQUI 126 (die casting units), which shares STRU 50 with EQUI 115, one makeup air unit (EQUI 109) and a water-based dip/drip coater (EQUI 116), is required to show compliance with applicable PM_{10} and $PM_{2.5}$emission limits by means of daily calculations because EQUI 125 and EQUI 126 were not modeled at design capacity. The contribution from EQUIs 109 and 115 unrestricted potential to emit were added to the calculation to demonstrate compliance with from the modeled emission rate for $PM_{10}$and $PM_{2.5}$at STRU 50. Only the contribution from EQUIs 115 unrestricted potential to emit was added to the calculation to demonstrate compliance with from the modeled emission rate for lead NAAQS at STRU 50 because the lead emissions from EQUIs 109 are orders of magnitude lower. Since EQUI 115 was modeled at rated capacity, the 365-day rolling sum of lead emissions at STRU 50 were not included as this will count towards the facility-wide cap on annual lead emissions from die cast. Additionally, the permit does not have flexibility provisions for the abrasive blasting.

Performance testing to demonstrate compliance with PM_{10}/$PM_{2.5}$and lead is required at STRU 57 (venting controlled emissions from abrasive blasting EQUI 113 and 114) to verify controlled emission rates for the abrasive blasting units that were used for modeling. This is because the claimed controlled efficiencies from TREA 52 (HEPA Filter) are relatively high. This will also serve to verify emission calculations for EQUI 115 as the same calculation method was used.

- **Combustion**
  The facility has several combustion units, including melting pot heaters, a natural gas bake oven, makeup air units (MAUs), roof top units (RTUs), and space heaters, many of which have potential emissions below the thresholds listed at under Minn. R. 7007.1300, subp. 3(F). Since the permit requires limits on nitrogen oxide (NOx) emissions to meet applicable NAAQS, these units are no longer insignificant activities and have been added to the subject item inventory. Uncontrolled PTE of criteria pollutants, HAPs, and greenhouse gas (GHG) emissions from natural gas-fired melting pot heaters, a natural gas bake oven, MAUs, RTUs and space heaters were calculated using emission factors from AP-42, Chapter 1.4, Table 1.4-2, 1.4-3, and 1.4-4. Emission factors for GHG emissions were obtained from 40 CFR pt. 98. Uncontrolled combustion emissions from the emergency generator were calculated using emission factors from AP-42, Chapter 3.3, Table 3.3-1 (criteria pollutants), Table 3.3-2 (HAPs) and 40 CFR pt. 98 (GHG).

  Calculation of lead emissions at stacks where MAUs share with die cast and abrasive blast units were not included as the lead emissions from MAUs are very small compared to lead processing units.

- **Fugitive emissions**
  40 CFR § 52.21(b)(20) defines fugitive emissions as emissions "… which could not reasonably pass through a stack, chimney, or other functionally-equivalent opening." Sources of fugitive PM/PM_{10}/$PM_{2.5}$ emissions from the facility were defined for paved road traffic and cooling towers and included in dispersion modeling to determine facility impacts on ambient PM_{10} and $PM_{2.5}$concentrations. $PM_{10}$and $PM_{2.5}$were conservatively assumed to be equal to PM emissions.

Paved roads

Paved road emissions were calculated using equations from AP-42 Chapter 13, Section 13.2.1 (01/11). The silt loading value obtained for corn wet mills (Table 13.2.1-3) was assumed to be representative of paved roads at Water Gremlin because no material handling occurs outdoors, and outdoor material storage piles are not maintained at either facility. Paved roads used for employee parking were not evaluated per MPCA guidance.

Cooling towers

The cooling towers at the facility are used to dissipate large heat loads to the atmosphere. Because wet cooling towers provide direct contact between the cooling water and the air passing through the tower, some of the liquid water may be entrained in the air stream and be carried out of the tower as "drift" droplets. Therefore, the particulate matter constituent of the drift droplets derived from total dissolved solids (TDS) in the cooling water may be classified as an emission. Fugitive PTE from both cooling towers was calculated using AP-42 Chapter 13, Section 13.4 (Rev 01/95) using procedures described for source-specific TDS content.

- **Remediation stack**

  Controlled Emissions

  The MPCA's Remediation Division requires that emissions from the remediation stack are controlled by two 2,000-pound granulated activated carbon (GAC) canisters connected in-series (TREA 50 and TREA 51) as described in Section 3.2.3 below. The remediation stack vents emissions from the required operation of the Sub-Slab Depressurization and Solvent Vapor Extraction system. The permit requires sampling of the remediation system stack (STRU 41) in accordance with the requirements of the MPCA Remediation Division to determine emission rates. When required, emissions must be reported. t-DCE emissions are calculated as follows:

  t-DCE Emissions (pounds/day) = [Measured t-DCE Remediation Stack Concentration (ug/L)] x [Remediation Stack Ventilation Rate (ft3/min)] x [28.32 L/ft3] x [60 min/hr] / [1,000,000 ug/g] / [453.6 g/lb] x [24 hr/day]

  Uncontrolled Emissions

  The permit application includes modeling of uncontrolled emissions from the remediation stack in the event the MPCA's Remediation Division determines operation of the GAC canisters is no longer required. The uncontrolled emissions were determined by calculating emission rates based on SSDS/SVE influent (prior to control) data obtained on January 28, 2022 and using the highest influent concentration. The AERA analysis includes the analysis of uncontrolled emissions from the remediation stack, so even if this operation scenario were to occur, the risks from this to human health were determined to be within acceptable ranges. The modeled uncontrolled emission rates for t-DCE and TCE are included in the permit as an emission limitation to provide the public assurances that even very small sources of t-DCE and TCE from the mitigation system were included in the assessment of health impacts. The uncontrolled t-DCE emissions from the remediation stack are several orders of magnitude smaller than the emission limit from coating operations and therefore are not included in the calculation to demonstrate compliance with this limit. In addition, the emissions from the mitigation stack are not expected to increase due to the permit conditions on coating operations, material handling of VOC and the solvent vapor mitigation system.

- **Tin processing units**

  The facility also manufactures tin sinkers as part of their lead-free fishing tackle line. The facility has one electric melt pot dedicated to tin only where hot metal is either die casted or extruded into wire and cut with the billet saw (also used for lead sinker production). Particulate emissions from tin processing were calculated using the same emission factors that were used for the lead melt pots and billet saw (Section

Commented [A20]: This should be removed. Uncontrolled emissions were evaluated. The air permit does not need to include conditions for the control of the mitigation system. Including these requirements once in the permit and requiring a lengthy and expensive amendment to remove them is unnecessarily burdensome.

3.1.2). Other activities, including cold forming (coining), hot/cold extrusion, and packaging processes qualify as insignificant activities not required to be listed under Minn. R. 7007.1300, subp. 2.C(2).

- **Insignificant activities required to be listed**
  Certain activities were verified to be below insignificant thresholds described in Minn. R. 7007.1300, subp. 3(F). VOC emissions from parts washing were calculated using mass balance from maximum materials content and maximum throughout, assuming 100 percent of VOCs used are emitted. Other insignificant activities conducted at the facility include intermittent welding and brazing activities for which emissions estimation and testing is not feasible.

Attachment 1 to this TSD contains a summary of the PTE of the Facility, including detailed spreadsheets and supporting information prepared by the MPCA and the Permittee.

3.2 Pollution control equipment

The facility was required to install, operate, and maintain pollution control equipment at the minimum overall control efficiency assumed in the model. This section describes the pollution control equipment installed, pollutant capture efficiency, and maintenance actions required by the permit.

- **Lead processing units**
  Melting pots release emissions of lead and PM due to the heating of lead ingots and handling of molten lead. Die casting units use mineral oil as a lubricant on die tool surfaces to promote smooth release of parts from casting tools. As a result, the mineral oil is atomized and released into the air due to pressure release from die tools, resulting in PM and lead emissions. To control these captured emissions, the facility has added Nederman mist eliminators with HEPA filtration to the majority of lead melt pots and die casting units at the facility. The mist collector plates trap atomized mineral oil in the exhaust gas using the inertia present in the oil droplets. Particles not trapped by collector plates are then captured by the HEPA filter.

  To achieve additional control of captured PM/PM_{10}/$PM_{2.5}$, the die casting units and lead melt pots will each continue to vent to low-efficiency electrostatic precipitator (ESP), also known as a Smog Hog, connected in-series with a Nederman filter. Single pass Smog Hogs are configured such that particles in exhaust gas become charged and then pass over oppositely-charged collector plates. The charged particles then attach to the oppositely-charged collector plates, and the cleaned air exits the unit. Double-pass Smog Hogs act the same as single-pass but the pollutant-laden gas passes over two sets of collector plates (longer collection path) with double the power, thus achieving greater pollution control. With the addition of the Nederman filters, the overall pollution control efficiency for lead processing units was assumed to be greater than or equal to 86.6 percent. Therefore, the permit will require a minimum of 86.6 percent control efficiency for PM/PM_{10}/$PM_{2.5}$for units controlled by combination mist eliminators with HEPA filtration. The Permittee is required to operate and maintain Nederman filters at all times whenever lead processing units are in operation, including performance testing (Section 3.4), periodic inspections, cleaning, filter replacement, and recordkeeping.

- **Spray coaters**
  The Permittee is required to operate individual HEPA filters on most spray coaters. The uncontrolled emissions from most spray coaters are captured and controlled with HEPA filters before emissions are released from coating rooms through the common stack (STRU 73). Based on manufacturer's specifications, the facility assumed 99 percent control efficiency of PM/PM_{10}/$PM_{2.5}$emissions from controlled spray coating operations. This level of control efficiency is needed in order to comply with applicable NAAQS. The permit enforces the minimum control efficiency of the HEPA filter and requires that it be in operation at all times, including performance testing (Section 3.4), periodic inspections, cleaning, filter replacement, and recordkeeping. Certain UV coaters, which use spray application, are not

required to operate with HEPA filters. These units were modeled for compliance with $PM_{10}$and $PM_{2.5}$ NAAQS while using uncontrolled emission rates.

- **Solvent vapor remediation system**
  A permanent sub-slab depressurization and solvent vapor extraction system with two 2,000-pound GAC canisters connected in-series has been installed at the facility to extract and capture solvent vapors from the vapor space below the North Building floor. The plumbing, blower fan, and carbon canisters collectively make up the solvent vapor remediation system (COMG 9). Vapor phase carbon design loading modeling performed by the manufacturer, H2K Technologies, utilized the average of the ten highest sub-slab vapor concentrations for TCE and t-DCE treated by 2,000 pounds of GAC. The modeling data shows TCE breakthrough of the lead (first) canister at 300 days, and no t-DCE breakthrough of the lead (second) canister prior to 300 days. Therefore, there is reasonable assurance the carbon filtration system demonstrates 100 percent control of TCE and t-DCE emissions over 300 days of continuous operation.

  Sampling and analysis of influent between TREA 50 and TREA 51 conducted through September 2019 showed reduction higher than 95 percent for TCE, t-DCE and other chlorinated organic compounds of interest. This is indicative that uncontrolled emissions have achieved asymptotic levels. Sampling and analysis of uncontrolled emissions conducted in January of 2022 at the solvent vapor remediation system stack (STRU 41) confirmed very low uncontrolled emissions of t-DCE as compared to the t-DCE emission limit for COMG 1. The Permittee conducted an air toxic analysis using the uncontrolled emissions from COMG 9 and showed impacts in compliance with MPCA approved health benchmarks. Because of this, the compliance emission calculations for t-DCE will not include emissions from COMG 9.

  At the time of permit issuance, the MPCA Remediation Division requires the Permittee to operate and maintain the solvent vapor remediation system at all times, including gas sampling, periodic inspections, periodic GAC canister replacement, and recordkeeping. The permit requires the Permittee to operate the GAC canisters as described in the permit for as long as this is required by the MPCA Remediation Division.

- **Abrasive blasting**
  The facility operates abrasive blasting units at the facility that emit PM/PM_{10}/$PM_{2.5}$and lead as described in Section 3.1.4. In order to comply with the $PM_{10}$and $PM_{2.5}$NAAQS standards, the facility is capturing and controlling all emissions with a HEPA filter installed on each blasting media collection exhaust system. The HEPA filters are rated by the manufacturer to achieve 99.9 percent control efficiency of particulate emissions. The Permittee is required to operate and maintain the HEPA filtration system at all times, including during periodic inspections, replacement, and recordkeeping.

3.3 Compliance demonstrations

The facility was required to accept state and federally-enforceable emission and operation limits such that the facility remains protective of all applicable health benchmarks and NAAQS standards, including limits on emissions to avoid PSD regulations and Part 70 applicability. This section describes the actions required by the permit for the facility to demonstrate compliance with limits enforced by the permit.

- **VOC limits**
  The permit contains a federally-enforceable limit of 90 tons per year on VOC emissions applicable to coating operations such that the facility remains below PSD and Part 70 permitting thresholds. To demonstrate continuing compliance with the limit on a monthly basis based on daily operating records, the permit requires that the facility track daily usage of VOC-containing materials, including (but not limited to) VOC coating, water-based coating, UV coating, VOC solvent recovered from the distiller, VOC that exits the facility as waste, and other VOC-containing material on a daily basis.

Commented [A21]: All permit conditions related to the mitigation system are unnecessary and should be removed.

Commented [A22]: There is no justification to have the air permit duplicate requirements from the Remediation Division when the uncontrolled air emissions were shown to be insignificant.

Commented [A23]: This is vague and unworkable. Many regular household and commercial products, such as cleaning products, contain VOCs. The significant usage will be captured by the aforementioned tracking.

The permit includes Material Content requirements, which establish the maximum allowable VOC content of the VOC coatings used at the facility. While the VOC coatings contain the largest proportion of VOCs, there are small amounts of VOCs released by water-based coatings and UV coatings that must be used in VOC calculations to demonstrate compliance with the 90 ton per year limit. Using daily usage records and material VOC contents as determined by the Material Content requirement in Appendix B of the permit, the facility is required to calculate monthly VOC emissions using formulas specified in the permit and record total VOC emissions for each operating month. Finally, the permit requires the facility to calculate and record the 12-month rolling sum of VOC emissions for the previous 12-month period. Other sources of VOCs are combustion sources which amount to much less than 10 tons per year so that there is enough compliance to keep the facility under 100 tons per year of allowable VOC emissions.

- **t-DCE limits**

The permit contains a state-enforceable limit of 32.6 tons per year on t-DCE emissions such that ambient concentrations of t-DCE remain below the MDH chronic inhalation Risk Assessment Advice (RAA) health benchmark of 20 micrograms per cubic meter, as described in the AERA conducted and the discussion on the weight of evidence approached used in the technical analysis in support of this permit action (Section 3.6 and Attachment 1 and 1.a). Operating records from 2021 and 2022 and ambient air measured concentrations of t-DCE demonstrate that Water Gremlin operated at emission levels of t-DCE which are very close to the limit determined to protect human health. Given the thin margin of compliance based on actual operations in 2021 and 2022, the MPCA deemed it prudent and necessary to require daily compliance demonstrations based on a 365-day rolling sum of t-DCE emissions. Daily compliance demonstration will enable Water Gremlin to discover exceedances to the t-DCE limit and to implement corrective actions much sooner than if the compliance verification is done on a monthly basis.

Commented [A24]: See petition for contested case hearing and comment letter regarding the TDCE limits.

In order to demonstrate continuous compliance with the limit on a daily basis, the permit requires that the facility track all t-DCE-containing materials, including (but not limited to) t-DCE containing material usage, t-DCE recovered from the distiller, t-DCE that is reused, t-DCE that exits the facility as waste on a daily basis. The t-DCE usage, t-DCE recycling in the coating room, t-DCE recovered from the distillation unit and what leaves the facility is tracked by manually weighing the t-DCE-containing materials on a daily basis.

The tracking of t-DCE is done by conservatively assuming that all VOC in VOC coatings is t-DCE. The reason for this conservative assumption is because the exact content of t-DCE in the VOC coatings was certified as not public data by MPCA on January 25, 2019. In order to show compliance with permit limits, the data to be used must be public as it is considered emission's data as defined at in 40 CFR 2.301(a)(2)(i). Therefore, the only data that can be used for determining compliance with t-DCE limitations is the VOC content of coating material which has been disclosed as public data. The VOC content is a conservative estimate of t-DCE because there are other VOCs in the VOC coating formulations. As noted above, the permit includes Material Content requirements, which establish the maximum allowable content of the VOC coatings used at the facility.

The MPCA considered the requirement to use automatic meters on each coater to track t-DCE usage in the coating room, which is the highest figure in the computation of t-DCE emissions. Properly maintained and operated automatic coating meters minimizes the potential for error and increases consistency compared to manual measurements recorded by multiple workers. The MPCA discussed this option with Water Gremlin, and they explained this was not a viable option for operations at this facility. While automatic coating meters are more commonly used in automated coating operations, the t-DCE coating operations at Water Gremlin are done with a significant amount of manual labor. Another aspect of the use of solvent and coatings that makes is difficult to use automatic meters is the fact that

while the t-DCE coating material is applied and some of it (excess that drips to the bottom of the coater) is reused at the coater. Additionally, a fraction of what is used in coaters is manually recovered, weighed, and sent to the distillation unit outside the coating room for cleaning before it is returned to the coating room for reuse. The recovered solvent to be cleaned is collected and recovered in batches, which is not how automatic readers usually work. Instead, Water Gremlin proposed in the permit application a detailed protocol for daily tracking based on manual weighing that they had been using to comply with the Administrative Order, with some revisions. The proposed tracking protocol was reviewed and approved by MPCA to be used in the permit. In order to verify the reliability of the manual methods to directly measure the t-DCE usage, the permit includes the use of a Continuous Emission Monitor System (CEMS) installed at the coating room stack and also requires quarterly audits based on solvent purchase records and inventory at hand. These verification requirements are further explained at 3.3.8 below.

Commented [A25]: The CEMS does not measure TDCE directly, it measures all VOCs and reports Total Hydrocarbons as TDCE. The CEMS is not necessary as daily recordkeeping and frequent inventory audits are sufficient to verifying usage. Other facilities are not subject to this overregulation.

The permit defines the type of t-DCE formulation that can be used and requires the use of specific manufacturer's information on the composition of the t-DCE containing material (Material Content requirement) for compliance demonstration. Using daily usage records and material t-DCE contents as determined by the Material Content requirement of the permit, the facility is required to calculate t-DCE emissions using formulas specified in the permit and record total t-DCE emissions for each operating day, including emissions from evaporation loses outside coating rooms. Finally, the permit requires the facility to calculate and record the 365-day rolling sum of t-DCE emissions for the previous 365-day period.

- **$PM_{10}/PM_{2.5}$ limits**

The permit contains federally enforceable limits on PM_{10} and $PM_{2.5}$ emissions such that the facility remains below Part 70 permitting thresholds (synthetic minor limits), and to comply with applicable NAAQS standards for PM_{10} and $PM_{2.5}$. The permit includes Material Content requirements, which establish the maximum allowable solid content of the VOC and water-based spray coatings used at the facility. The facility will show compliance with the emission limits by establishing maximum allowable material usage, or process throughput, enforceable control equipment operation, emission factors and transfer efficiencies from stack testing and daily emission calculations. Daily recordkeeping of operation and material usage is required to ensure compliance with these requirements. Because the sum of limited emissions at each stack results in allowable emissions of PM_{10} and $PM_{2.5}$ below 90 tons per year, and compliance verification with stack limits is conducted on a daily basis, it was deemed sufficient to demonstrate compliance with synthetic minor limits for PM_{10} and $PM_{2.5}$.

The permit requires the facility to show continuing compliance with PM_{10} and $PM_{2.5}$NAAQS standards by establishing PM_{10} and $PM_{2.5}$emission limits at every emission point based on the results of the dispersion modeling. In addition, each emission unit is required to vent to a specific emission point and to operate control equipment that is consistent with the assumptions made in the dispersion model. Demonstration of compliance with the emission limit at each emission point is based on a daily calculation of actual emission rates based on records of actual operating rates, known and approved emission factors or transfer efficiencies for each emission unit, and enforceable control equipment performance. The calculations for this compliance demonstration are defined in the permit for each emission point for which there are no limitations on the allowable hours of operation, and/or allowable process throughput is less than design capacity or the design capacity is not known, and/or the emission factor, transfer efficiency or control efficiency could change after testing is conducted to verify these parameters assumed for calculations. In addition, dispersion parameters assumed by the model, such as stack height, discharge direction, etc., are also enforced as permit conditions. Changes to these dispersion parameters trigger revisions to the modeling for NAAQs and the AERA analysis.

Some emission units, such as coining units modeled in compliance with applicable NAAQS and health benchmarks, using their calculated unrestricted potential to emit, but modeled assuming daily limited hours of operation. The permit includes restrictions of on these units to operate within the window of hours in each day that were assumed in the modeling. Since the facility did not propose any limitations on capacity, throughput, or emissions, the only compliance demonstration that is needed is records of the time of each day when these units are in operation of the is necessary for these units. Additionally, the permit does not have flexibility provisions for coining units.

Emission factors, transfer efficiencies and pollution control efficiencies are used to show the facility remains below Part 70 permitting thresholds, and to demonstrate compliance with emission limits at every emission point used in the model. Several of these parameters will be verified by performance testing required by the permit. Emission factors and transfer efficiencies will be updated by the most recent MPCA-approved performance test required by the permit. If revised emission factors or transfer efficiencies change and there has not been a modification at the facility that necessitates increase in emission limits, the permit requires the use of ARM requirements to update the emission factor or transfer efficiency used in compliance calculations without having to change the emission limit at each release point. If the facility wishes to make modifications to emission units that need increase in emissions limits, allowable process rates or required control efficiencies a major permit amendment will be required to revise these. Changes to emission limits trigger revisions to the modeling for pollutants for which a NAAQs analysis was conducted.

- **Lead limits**

The permit contains state and federally enforceable limits on lead emissions such that the facility remains below the lead NAAQS standard and lead ingestion health benchmark. The emission limit to remain in compliance with the lead NAAQS standard is established at each emission point as pounds per day 92-day rolling average. The emission limit to remain in compliance with the lead ingestion health benchmark is established at each emission point as pounds per year 365-day rolling sum.

The facility will show compliance with lead NAAQS and to remain below the lead ingestion health benchmark by establishing emission limits at every emission point based on the results of the dispersion modeling and AERA. With few exceptions, both separate daily calculation of compliance with the lead NAAQS and the lead ingestion emission limits are required. In addition to transparency, this is required because if the emissions calculations show there is non-compliance with one set of limits, the compliance status for the other set of limits can be readily verified and the facility would be able to promptly address the situation based on the specific averaging times of each set of limits. In addition, each emission unit is required to vent to a specific emission point and to operate control equipment consistent with the assumptions made in the dispersion model. Compliance demonstrations with the lead emission limits is based on daily calculations of actual emission rates based on daily operating records for every lead emission unit using known emission factors and required pollution control efficiencies. The calculation for these demonstrations is defined in the permit for each emission point for which there are no limitations on the allowable hours of operation, and/or allowable process throughput is less than design capacity or the design capacity is not known, and/or the emission factor or control efficiency could change after testing is conducted to verify these parameters assumed for calculations. The die casting units have an annual cap on lead processing rates and lead emissions to show compliance with the lead ingestion health benchmark. A separate calculation for compliance with 365-day rolling sum limits is required for all the die casting units at COMG 16. Changes to dispersion parameters trigger revisions to the modeling for NAAQS and the AERA analysis.

Selected emission factors and pollution control efficiencies used to determine potential to emit parameters used in the dispersion modeling and AERA will be verified by performance tests required by the permit. Emission factors may be revised based on the results of the most-recent performance test

Commented [A26]: The modeling results are not close to the lead NAAQS standard. There is a large margin of compliance; the emission limits and the limit for compliance with the lead ingestion HBV is the limiting factor. The 92-day-rolling average merely replicates the form of the lead NAAQS.

Commented [A27]: This should be RASS.

required by the permit. In order to revise emission factors based on stack test results, the permit requires the use of ARM requirements. If revised emission factors result in the need to increase emissions limits, further restrict allowable process rates or change required control efficiencies, a major permit amendment will be required to revise enforceable emission factors and may include a revised dispersion model in order to determine revised (lowered) process throughput and emission limits.

- **Nitrogen dioxide (NO_2) limits**
  The dispersion model showed compliance with one-hour NO_2 NAAQS when using emissions derived from heating and air conditioning units with a total allowable heat input of 10.69 MMBtu/hr and 2.29 MMBtu/hr at the North Building (STRU 38) and South Building (STRU 42), respectively. In order to comply with the NAAQS, the permit contains a federally-enforceable limit on total non-engine combustion capacity at each building and defined months of the year when they can be operated. The Permittee is required to keep an up-to-date inventory, including individual and total capacity, of all non-engine combustion units and is required to show that the total capacity remains below the permit limit, including recordkeeping of when the units are being operated. Changes emission limits trigger revisions to the modeling for pollutants for which a NAAQs analysis was conducted.

- **Coating room permanent total enclosures**
  Enforcement investigations prior to the Agreement revealed that the facility emitted HAPs (TCE) greater than major source thresholds since 2002 and, therefore, was subject to the requirements of 40 CFR pt. 63, subp. MMMM - National Emission Standards for Hazardous Air Pollutants for Surface Coating of Miscellaneous Metal Parts and Products. As a result of the Agreement, permit conditions were incorporated into this permit action such that HAP-containing materials are not permitted to be used at the facility; therefore, 40 CFR pt. 63, subp. MMMM no longer applies. However, Permit No. 12300341-003 did not contain all the necessary enforceable permit conditions to ensure coating operations were operated and maintained in permanent total enclosures as per current accepted standards for proper operation. As a result, the methods required to maintain coating rooms as permanent total enclosures required under Subpart MMMM were adapted into the permit. MPCA determined these are appropriate and adequate methods to ensure all solvent vapors (VOCs) from coating operations, including t-DCE, are captured inside the coating room and vented to the common stack (STRU 73). The permit conditions require continuous monitoring of coating room pressure differential, including audible and visual alarms that alert when coating room pressure is above the pressure drop limit established by Method 204 of Appendix M to 40 CFR Part 51. The permit also requires inspection and maintenance of pressure drop monitoring devices, daily inspection of enclosure integrity, and annual testing of the enclosure to ensure it meets the definition described above following EPA Method 204 in Appendix M of 40 CFR Part 51.

  During remediation investigations required by the Agreement, solvent vapor intrusion into sub-slab vapor space was detected, further indicating that the coating rooms were not being maintained as total enclosures. Subsequently, in addition to the mitigation system described in Section 3.2.2, the Order required that the facility install and maintain a permanent, impenetrable barrier on the concrete floors of each coating room such that no solvent vapors penetrate and further contaminate the sub-slab vapor space. The permit requires inspections of the floor coating (Retro Coat) for degradation each operating day, including maintenance, reporting, and shut-down requirements if degradation is observed.

  Some coaters at the facility operate outside of a coating room. These coaters use water-based or UV coating (very low VOC). The unrestricted potential emissions were modeled from these units and the results demonstrated compliance with the applicable NAAQS and health benchmarks. Therefore, the permit authorizes operation of these units outside of a coating room (total enclosure) and under the modeled conditions.

Commented [A28]: This is a mischaracterization. Water Gremlin self-reported the TCE issue and resolved all agency concerns.

Commented [A29]: Applying and enforcing regulations that do not apply to a facility is inappropriate and unnecessary. There is no regulatory basis for applying the NESHAP requirements to non-NESHAP operations.

- **Solvent vapor remediation system emissions**
  The permit requires sampling of the remediation system as required by the MPCA Remediation Division prior to the first (lead) canister, between the two canisters in-series, and after the second (lag) canister to detect emissions and verify GAC media quality. Based on manufacturer's operation recommendations, the permit requires GAC canister replacement after 300 days of continuous operation or sooner if recommended by the manufacturer. There is a sunset provision for this requirement in the permit that will become effective when the MPCA Remediation Division approves the removal of the GAC canisters for emissions control from the remediation stack. The uncontrolled emissions from the remediation stack have been characterized as part of the AERA analysis to ensure protection of human health in the event of cessation from GAC canister operation.

Commented [A30]: As noted above, these provisions should be removed from the permit.

- **Verification of process records as primary compliance demonstration method for t-DCE emission limits.**
  The MPCA deemed it prudent and necessary to have a primary method of compliance demonstration which should be evaluated for reliability in more than one way. As described in Section 3.3.2 above, the permit requires the facility to track usage and handling of t-DCE-containing materials by manual weighing t-DCE-containing materials on a daily basis. This is the primary compliance demonstration method.

  During 2021 and the first quarter of 2022, Water Gremlin operated at t-DCE emission rates very close to the t-DCE emission limits established in the permit to protect human health based on the Minnesota Department of Health's Risk Assessment Advice (see Figure 1). The existing ambient monitoring network measurements confirm that the coating operation impacts for the last quarter of 2021 and first quarter of 2022 expressed as 365-day rolling average are near the maximum ambient concentration deemed to be protective of human health (see Figure 2), even after taking into account that coating lines did not operate between August 24, 2019 and January 22, 2020.

Commented [A31]: This is inaccurate. There were no limits established during this timeframe. See the comments in the petition for contested case hearing and permit comment letter.

Commented [A32]: See the comments in the petition for contested case hearing and permit comment letter.

  Water Gremlin has not made any specific commitments to accept enforceable conditions that will further reduce emissions to levels below the permit t-DCE emission limit during the life of the permit. Therefore, the margin between the permit limit and the Permittee's anticipated operations is small, meaning that small deviations from the permit conditions have the potential to result in emissions exceedances over the permit limit and, therefore, the compliance verification process needs to be as frequent as possible. To that end, the form of the emission limit is an annual limit based on a 365-day rolling sum. Daily recordkeeping to show compliance is required by the permit and this will make exceedances less likely because the Permittee will evaluate its usage and take corrective actions on a daily basis.

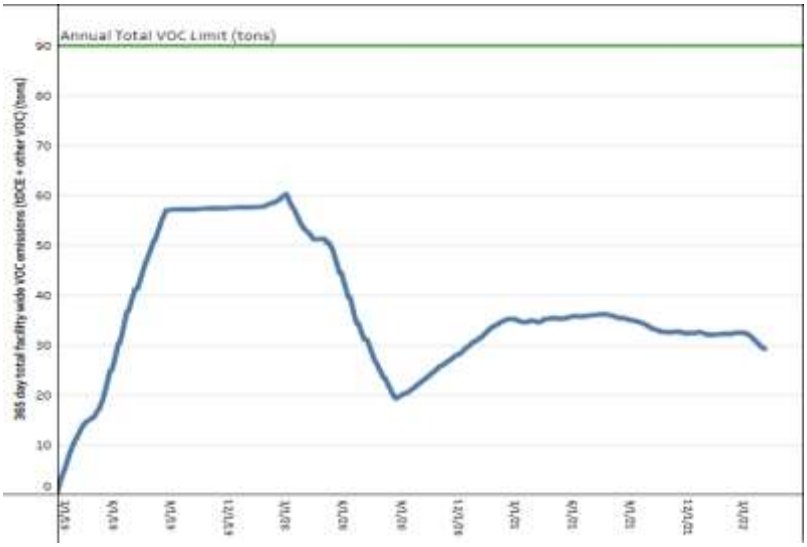
Commented [A33]: This is incorrect. See comments in the petition for contested case hearing and permit comment letter.

Commented [A34]: See comments in the petition for contested case hearing and permit comment letter.

  To verify that the daily manual tracking and recordkeeping is accurate and reliable, the permit includes two types of evaluations or audits of the primary compliance demonstration methods. The first audit method is the operation on a CEMS at the coater stack (STRU 73) along with the use of a correlation of solvent usage versus CEMS readings at the stack. The second method is a usage audit based on t-DCE containing material purchasing records and t-DCE containing material inventory at hand.

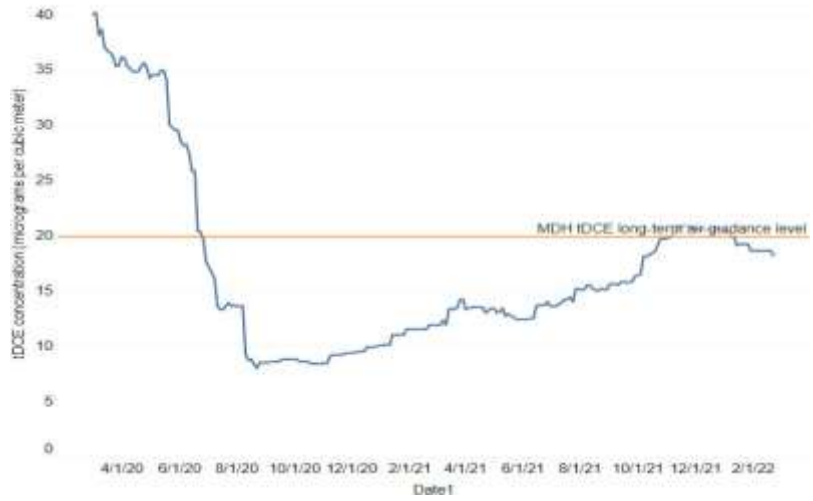
Commented [A35]: The CEMS is neither accurate, as it does not measure TDCE, nor reliable, as it reports total hydrocarbons. The CEMS should not be a permit requirement. MPCA has other methods of verifying usage and recordkeeping, such as the usage audit.

Figure 1. Cumulative annual VOC emissions, including t-DCE emissions*



* Coating lines did not operate between August 24, 2019 and January 22, 2020, by MPCA administrative order. Data is included in Attachment 6.

Figure 2. Highest 365-day rolling average concentrations of t-DCE monitored around Water Gremlin*



*Data is included in Attachment 6

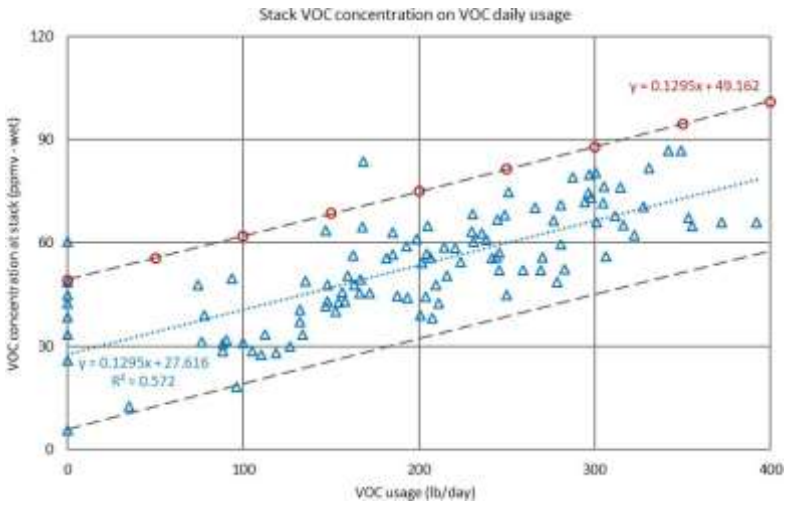
Commented [A36]: This figure shows the highest of the five monitors and represents them as affecting a single receptor, which is inaccurate.

Correlation of solvent usage versus CEMS readings at the stack

The permit requires the facility to install, operate, and maintain a CEMS that records actual VOC emission concentrations at the stack, as ppmv-wet Total Hydrocarbon Concentration (THC) as t-DCE. CEMS for VOCs are instruments that automatically and continuously measure concentrations of VOCs in air streams. In cases where there are more than one VOC compound present in the gases, the CEMS do not directly measure any specific VOC based its specific chemical composition. In the case of Water Gremlin, there are more than one VOC compound in the flue gases from coating operations, but the largest proportion is t-DCE. The use of CEMS in this case is considered a screening method to estimate VOC emissions because the results are a very good indicator of an emissions trend as it should follow the same trend as the records of solvent usage within an acceptable range. The permit requires the facility to keep electronic records of CEMS data and to submit monthly reports of measurements and conducted audits. Each day of coating operations, the CEMS results will be compared to an established correlation with t-DCE/VOC usage as a quality control indicator of t-DCE/VOC records. If the CEM results do not fall within the correlation envelope, it will trigger an audit of the recordkeeping process to be conducted by Water Gremlin. Any daily analysis where the CEMS readings fall outside this acceptable range will be reported to the MPCA along with the results of the audit.

The acceptable range between t-DCE/VOC usage records and CEMS results required by the permit was established by finding a linear trend between the emission values measured by the CEMS reading at the coating room stack (STRU 73) and the expected emission values calculated from daily t-DCE VOC usage based on daily usage of t-DCE containing coatings (daily usage value). The latter is required for compliance with the permit. For any of the 107 daily t-DCE/VOC usage values recorded from January 30, 2020 through June 3, 2020, the associated CEMS reading value (as ppmv-wet of THC as trans-1,2-Dichloroethylene) fluctuates around the trend line; that is, theoretically, there is a 50 percent chance for CEMS value to be above the trend and 50 percent chance to be below it (see Figure 3). Attachment 7 “Correlation of Solvent Usage Versus CEMS Readings at the Stack” includes the complete analysis of this data set.

Figure 3. Scatter plot of t-DCE usage versus CEMS data and regression curves



Commented [A37]: The correlation is not valid. It was based off measurements of THC, not TDCE, and correlated to usage tracked at different times. The usage is tracked by operating day, 6 am to 6 am. The CEMS typically reported results around 9 or 10 am, and not always based on the same operating hours.

Commented [A38]: The range was calculated using a 95% correlation, where 5% of the time BY DEFINITION the results would be outside the range. MPCA has years of data. It makes no sense to hold WG to a range that is based on different pollutants and to call values outside the range deviations.

While the trend line, expressed mathematically as y = 0.1295x + 27.616 where "x" equals daily VOC from t-DCE coatings usage and "y" equals the daily CEMS reading, reflects the central tendency of data association, it is the two dotted lines nearly parallel to the trend line that shows the spread of the data. For a given "x", there is a 95 percent chance of seeing a "y" value inside the area between the two dotted lines, known as the 95 percent confidence interval. Because the curve for the upper end of the 95 percent confidence interval is generated through a number of steps (regression analysis), we found an approximate equation for the curve, expressed as y = 0.1295 x + 49.162, we call it the upper bound equation. A complete description of the observed data for this situation includes both the trend and the data spread. See the Table 6 below, Attachment 7 and Figure 3 above.

In order to demonstrate proper accounting of t-DCE/VOC (mostly t-DCE emissions) through daily usage records, the Permittee is required to calculate "x", which is daily t-DCE/VOC usage from t-DCE coatings, used each day and use that value to calculate the corresponding "y" value in the upper end of the 95 percent confidence interval (predicted CEMS reading). The Permittee can then see whether or not the actual CEMS reading for the day exceeds the upper end value calculated as described in the permit. If the actual CEMS reading for that day is greater than the CEMS reading predicted by the upper bound equation, this indicates that actual *VOC* usage is greater than what is being recorded. If this is the case, the Permittee must immediately audit VOC solvent usage records to determine the cause of the discrepancy, implement the needed corrections and report it as a deviation. In addition, the permit requires the submittal of a monthly VOC usage and CEMS results report that must include the results of any audit conducted as a result of this CEMS verification requirement.

Commented [A39]: This is not an accurate statement and would not indicate greater VOC usage.

Table 6. Linear regression data derived from actual t-DCE usage and CEMS data (1/13/2020 to 6/6/2020)

x (lb/day)	0	50	100	150	200	250	300	350	400
UPL (ppmv – wet)	49.41	55.69	62.04	68.43	74.88	81.38	87.94	94.56	101.22
Upper Bound Equation	49.16	55.64	62.11	68.59	75.06	81.54	88.01	94.49	100.96
% Relative Difference	-0.50	-0.10	0.12	0.23	0.24	0.19	0.08	-0.07	-0.26

Quarterly VOC solvent purchase and inventory audits and audit reporting

Each calendar quarter, the Permittee is required to audit purchase records and existing inventory of t-DCE-containing material, and t-DCE -containing material usage records, and keep records of each audit. The Permittee is required to submit the results of the quarterly audits with the annual report by the 31st of January. The Permittee is required to review and correct as needed the tracking of t-DCE containing materials if the audit shows significant discrepancies. The permit requires the submittal of a monthly VOC usage that must include the results of any audit conducted as a result of this quarterly VOC solvent purchase and inventory audit.

Commented [A40]: Redundant to require an audit every time the correlation equation is out of bounds AND every quarter. Inventory checks should be sufficient.

- **Emission units without compliance demonstrations**

  The combustion sources modeled in compliance with applicable NAAQS and health benchmarks, using their calculated unrestricted potential to emit, which were listed as emission rates at the STRU level. The permit does not have flexibility provisions for the combustion units associated with EQUI 101, EQUI 102, EQUI 103, EQUI 104, units in COMG 6 and EQUI 222 (Natural Gas Bake Oven). Since the facility did not propose any limitations on capacity, and only natural gas can be used by design, no compliance demonstration is necessary for these units as these cannot physically run at a higher rate.

3.4 Performance testing

The facility made several informed assumptions in limited potential to emit calculations and dispersion characteristics requirements to determine and/or verify emission factors and emission rates to demonstrate compliance with applicable VOC, t-DCE, PM_{10}/$PM_{2.5}$, and lead emission limits. The permit requires verification of emission factors for several emission units as well as testing for compliance with emission

limits. Appendix E to the permit contains the minimum recordkeeping that must be done during each stack test to verify emission factors and other compliance demonstrations. Appendix E also lists and ~~the~~ references EPA Stack Test Methods for each pollutant. The MPCA may deviate from this list in compliance with Minn. R. 7017.2020. Emission factors, transfer efficiencies stack flow rates and other compliance demonstration parameters may be re-set based on approves stack testing results based on ARM permit conditions described at above.

- **Battery terminal post coaters**
  The permit requires operation and maintenance of VOC/t-DCE CEMS and daily validation of results as described in Section 3.3.8. The CEMS has to be calibrated and maintained to ensure proper operation. In addition, the permit requires testing to measure PM_{10} and $PM_{2.5}$emission rates from coaters that apply coating using spray application, including VOC, water-based, and UV coaters, within 180 days following the issuance of the permit and every 60 months thereafter using EPA Reference Methods 201A and 202 (or other methods as approved by MPCA through the submittal and approval of a test plan) for $PM_{10}$and $PM_{2.5}$. The purpose of the test is to verify emission factors and pollution control efficiency and demonstrate compliance with $PM_{10}$and $PM_{2.5}$emission limits enforced by the permit at STRU 73.

- **Lead processing units**
  In order to demonstrate the efficacy of emission factors used in PTE calculations, the permit requires recurring performance testing scheduled such that all Nederman filters and Smog Hogs are tested at least once every five (5) years using EPA Reference Methods 201A and 202 for PM_{10}/$PM_{2.5}$and Method 12 for lead. The purpose of the tests is to verify emission factors and pollution control efficiency, and demonstrate compliance with PM_{10}, $PM_{2.5}$, and lead emission limits enforced by the permit

Commented [A41]: The equipment is similar between die cast machines, Nederman filters, and smog hogs. Testing a sample of the equipment should be sufficient.

- **Coating room permanent total enclosure**
  The facility conducted an AERA in order to determine compliance with applicable health benchmarks, specifically t-DCE. Since the facility has characterized the main source of t-DCE emissions as being emitted from STRU 73, the permit requires the facility maintain all battery terminal post coaters using t-DCE in rooms that are permanent total enclosures meeting the criteria of Method 204 in Appendix M of 40 CFR Part 51. The facility conducted a performance test on September 25 and October 3, 2019, in which compliance with the pressure drop limit described under Method 204 in Appendix M of 40 CFR Part 51 and the permanent total enclosure criteria of EPA Method 204 in Appendix M of 40 CFR Part 51 was demonstrated. The MPCA concluded the pressure drop limit required by 40 CFR pt. 63, subp. MMMM was an appropriate and necessary operating standard to ensure the coating room operates as a total enclosure. This minimum pressure drop of less than or equal to -0.007 inches of water and other operational requirements are enforced by the permit as appropriate and necessary conditions under Minn. R. 7007.0800. With this operation requirement in the coating rooms, the AERA is approved to assume all coating emissions in the coating rooms connected to STRU 73 do indeed vent to STRU 73. The permit requires recurring performance testing on an annual basis for all coating rooms in COMG 5 to ensure the permanent total enclosure is being operated and maintained according to the permit.

3.5 NAAQS dispersion modeling

The facility was required to complete dispersion modeling per the MPCA's current dispersion modeling practices to show modeled compliance with NAAQS for criteria pollutants, including the 24-hour PM_{10}, annual and 24-hour $PM_{2.5}$, annual and 1-hour NO_2, and 3-month lead standards specified under 40 CFR pt. 50. The results of the dispersion modeling are shown in Table 7. Operating restrictions and dispersion parameters were assumed when the modeling was conducted, so these have been incorporated as emission limits and operation requirements. Compliance with these operating restrictions and dispersion characteristics is effective on the date of permit issuance (e.g., coating usage, lead throughput, operation of control equipment at the assumed control efficiencies, increased stack height, stack direction, flue gas exit velocity, etc.). In addition, per MPCA practice, a table of the modeled parameters has been added to the

permit as Appendix C. Other than the specific operating restrictions mentioned above, the parameters listed in Appendix C of the permit describe the operation of the facility at maximum capacity. In other words, the parameters listed in Appendix C represent the minimum dispersion parameters at the maximum emission rates allowed by this permit. Compliance with the operation restrictions and dispersion characteristic requirements ensure compliance with the worst-case conditions of air emissions allowed by this permit. The purpose of listing the parameters in the permit appendix is to provide a benchmark for determining if and when additional modeling is required.

Table 7. NAAQS/MAAQS modeling results

Pollutant	Averaging Period	NAAQS standard ($\mu g/m^3$)	MAAQS standard ($\mu g/m^3$)	Total modeled concentration (includes background and nearby sources ($\mu g/m^3$)	Percent of standard (%)	
					NAAQS	MAAQS
Lead	Rolling 3 mo. Avg	0.15	0.15	0.13	84.31	84.31
NO_2	1-hr	188.0	188.0	149.83	79.70	79.70
	Annual	99.7	99.7	22.66	22.66	22.66
PM_{10}	24-hr	150.0	150.0	66.~~78~~75	44.~~52~~50	44.~~52~~50
$PM_{2.5}$	24-hr	35.0	35.0	33.~~81~~84	96.~~60~~69	96.~~60~~69
	Annual	12.0	12.0	11.~~39~~40	~~94.94~~95.03	~~94.94~~95.03

- **Equivalent or Better Dispersion (EBD) modeling and computer dispersion modeling triggers for NAAQS** Appendix C contains the benchmark parameters for determining if additional EBD or computer dispersion remodeling is required. The permit contains EBD modeling conditions that trigger when modifications cause a change to dispersion parameters or emission rates used in the previous model. If the modification does not demonstrate equivalent or better dispersion, the facility must conduct computer dispersion remodeling under the constraints of the proposed modification. The permit requires EBD or remodeling even for changes that do not require a permit amendment because continued compliance must be demonstrated regardless of requirements to submit permit applications or notifications. Additionally, in the case of modeling for PM_{10} and $PM_{2.5}$, NOx, and Lead, the emission limits at the stacks are much lower than the respective insignificant permit modification thresholds at Minn, R 7997.1250. Additionally, modeling shows a compliance margin of less than 10 percent for $PM_{2.5}$. Therefore, the verification of compliance with NAAQS may not be contingent to the triggering of a permit amendment requirement because this would not ensure continued modeled compliance with NAAQAs.

3.6 Air Emissions Risk Assessment (AERA)

The facility air emissions were characterized by an AERA to determine if emissions of any air toxics with known health benchmarks from the facility sources were predicted to cause ambient concentrations of air toxics above any known health benchmarks. Changes to dispersion parameters, emission rates of modeled air toxics, revision of health benchmarks to more stringent values for modeled air toxics or the introduction of new chemicals with known health benchmarks trigger revisions to the modeling for AERA analysis.

The active ingredient in the VOC solvent (t-DCE) was investigated to determine the emission limit in which the ambient air concentration of t-DCE due to emissions from the facility would remain below health benchmarks. The MDH developed chronic Risk Assessment Advice (RAA) in 2020 specifically for t-DCE air permitting applications at the Water Gremlin facility (Attachment 8). The MDH established the chronic

health benchmark of 20 micrograms per cubic meter (µg/m3) and the sub-chronic health benchmark of 200 micrograms per cubic meter (µg/m3). The chronic RAA is the most protective and it was used to derive the t-DCE annual emission limit to be enforced in the air permit. The chronic health benchmark was used to derive the t-DCE annual emission limit in consideration to the extended prior unpermitted exposures of this community. Because the chronic health benchmark is the most protective, compliance with the chronic health benchmark will ensure compliance with the MDH's sub-chronic health benchmark. On April 22, 2022, Water Gremlin submitted, as part of the comments on the Preliminary Draft Permit No. 12300341-101, a Technical Memorandum on the toxicity value for inhalation for t-DCE. In this Technical Memorandum, Water Gremlin proposed revised chronic and sub-chronic inhalation health benchmarks that are twice as large as those advised by the MDH. The MPCA and the MDH reviewed the April 2022 Water Gremlin's Technical Memorandum and supporting information and concluded it was not appropriate nor sufficient to revise the MDH's 2020 RAA. Attachment 9 documents the MDH's review of the Water Gremlin's Technical Memorandum on the toxicity value for inhalation for t-DCE dated April 22, 2022. The MPCA agrees with MDH's assessment and is therefore t using the chronic health benchmark of 20 micrograms per cubic meter (µg/m3) and the sub-chronic health benchmark of 200 micrograms per cubic meter (µg/m3) to establish the permit t-DCE emission limit for in support of the Water Gremlin draft Permit No. 12300341-101.

Commented [A42]: See petition for contested case hearing and comment letter regarding risk assessment methods, calculations, and the setting of TDCE limits.

Air impacts from t-DCE were analyzed through an AERA, by reviewing the actual measured t-DCE concentrations in ambient air around the facility and by also reviewing the corresponding facility operation records taken during the period of observations (see Attachment 6). Details of the AERA analysis are included in Attachment 1 and 1a. Given the availability of site-specific ambient air monitoring and t-DCE usage data, a weight of evidence approach was used to show that the facility can emit no more than 32.6 tons per year of t-DCE in order to remain below the MDH's health benchmark. This value is lower than the proposed limit that considered the AERA results alone. The analysis conducted to establish a limit of 32.6 tons per year of t-DCE is described in detail in Section 3.6.2. Therefore, the permit contains an enforceable permit limit such that t-DCE emissions remain below 32.6 tons per year 365-day rolling sum of all t-DCE emissions, both inside and outside coating rooms. A revised AERA and review of ambient monitoring data and solvent usage will be necessary if the facility requests a change in the VOC solvent formulation through a major amendment as required by the permit.

Commented [A43]: The ambient monitors are not located where the public is exposed. The health benchmark is a chronic benchmark meant to protect against a lifetime of exposure and is not the correct benchmark to apply.

Additional emissions were characterized by the AERA, including the emissions from the new UV coating operations, water-based coating, paired sub-slab and indoor air testing, and emissions from the controlled and uncontrolled air releases from the remediation system, to determine if emissions of any air toxics from these sources were above any known health benchmarks. UV coating operations result in emissions of the following chemicals or chemical types: Isobornyl Acrylate, 4-hydroxybutyl acrylate, 2-Benzyl-2-dimethlyamino-1-(4-morpholino-phenyl)-1-butanone, Rheological Additive, Visible photoinitiator, Photoinitiator, and Acrylated Resin. The MPCA does not have a health benchmark for any of these chemicals (those with known names and CAS#s) from any of the information sources used to obtain health benchmark information, including MDH, EPA, Cal EPA, and ATSDR. Since Michigan EGLE developed a health benchmark for isobornyl acrylate, a screening assessment was completed for this compound. The annual modeled concentration of isobornyl acrylate was approximately two micrograms per cubic meter, and the Michigan EGLE health benchmark was 14 micrograms per cubic meter annual average. Therefore, the concentration of this isobornyl acrylate that will be used at this facility was below a level at which further permit limits or further analysis would be recommended.

The water-based coating operation, and any other VOCs related to coating, were tested for significance with respect to health benchmarks in a screening risk assessment spreadsheet (RASS) based on either indoor air testing or laboratory analysis data. When these pollutants were measured below detection level concentrations, the detection level concentration was used to estimate emission rates. Any emission rate that resulted in an air concentration less than 10 percent of an inhalation health benchmark was excluded from further analysis and permit limit consideration.

In addition to showing compliance with lead NAAQS, lead was also investigated to determine if emission limits would be necessary to keep lead emissions below the 0.15 micrograms per cubic meter ingestion health benchmark. The AERA modeled maximum hourly and annual emission rates from each lead processing unit that would ensure the facility would remain below the lead health benchmark. These emission rates from each lead emission point are in the permit as state (health benchmark) enforceable or federally-enforceable (lead NAAQS) limits, including emissions calculations and recordkeeping.

- **Computer dispersion modeling triggers for AERA**
  Appendix C contains the benchmark parameters for determining if additional computer dispersion remodeling is required. The permit contains conditions that trigger when modifications cause a change to dispersion parameters or emission rates used in the previous modeling and AERA. If the modification triggers AERA updates, the facility must conduct computer dispersion remodeling and air toxics analysis under the constraints of the proposed modification. The permit requires remodeling and revised RASS/AERA even for changes that do not require a permit amendment because continued compliance must be demonstrated regardless of requirements to submit permit applications or notifications. In the case of modeling for lead, the emission limits at the stacks are much lower than the respective insignificant permit modification thresholds at Minn, R 7007.1250. In the case of t-DCE and other evaluated air toxics, the actual operation is expected to be very close the t-DCE emission limits. Therefore, the verification of compliance with modeling and AERA parameters for any of the chemicals of concern cannot be contingent to the triggering of a permit amendment requirement because this would not necessarily ensure continued compliance with health benchmarks.

- **Justification for MPCA Revision to Water Gremlin's Proposed t-DCE Emission Limits**
  An Air Emissions Risk Analysis (AERA) is an iterative process, where emissions are incorporated into an air dispersion model to estimate air concentrations around the facility. The air concentrations are then compared to health benchmarks to estimate cancer risks and hazard indices. Water Gremlin submitted with the final air permit application a final Risk Assessment Spreadsheet (RASS) with a STRU 73 emission rate of 76 tons per year, and a total facility emission rate of 77.23 tons per year. Water Gremlin modified the 1,2-(*trans*)-dichlorotheylene (t-DCE) risk characterization in the MPCA RASS from MPCA's webpage by deleting the MDH Risk Assessment Advice of 20 ug/m^3 and replacing that value with a Provisional Peer Reviewed Toxicity Value (PPRTV) from EPA's Superfund Program of 40 ug/m^3. This resulted in a total hazard index of 1.18 for the full facility. The MPCA and MDH have agreed upon and implemented a hierarchy for toxicity value information sources for over a decade. MDH toxicity values are first in the hierarchy and PPRTV values are fourth in this hierarchy. Therefore, MPCA would apply a value from the MDH before looking for a value from the EPA Superfund Program. Using the MDH value of 20 ug/m3, the total facility hazard index would be 2.36.

  Since a total hazard index represents the summed potential impacts from all pollutants, MPCA AERA guidance allows facilities to refine their hazard index summations into groups that reflect individual human health endpoints (e.g., respiratory, neurological, etc.). The MDH health benchmark for t-DCE was based on the sensitive health endpoint of immunological changes which is categorized in the 'blood/hematological' endpoint in the RASS. At the proposed emission rates from Water Gremlin, the endpoint-refined hazard index was 1.98. Initially Water Gremlin, for early modeling purposes, rounded down previous submittals of endpoint-refined hazard index to one significant figure and they were using the pre-agreed upon toxicity value hierarchy. From the MPCA's perspective, there was sufficient data on actual ambient monitoring measurements of t-DCE around Water Gremlin, concurrent daily t-DCE solvent use reports, and, therefore regardless of the RASS results in the final iteration, any actual facility-impacted concentrations measured from the ambient monitoring around Water Gremlin and reported actual t-DCE usage rates would be considered and reconciled for the final decision on the

Commented [A44]: See petition for contested case hearing and comment letter.

Commented [A45]: The multiple conservative assumptions are part of the reason that risk results are reported to one significant digit: additional precision is not realistic or appropriate.

Commented [A46]: See petition for contested case hearing and comment letter regarding the TDCE limits.

permit emission limit for t-DCE. The current result in the Water Gremlin RASS rounds to 2, and therefore requires further refinement.

Notably, Water Gremlin was operating right near the intended t-DCE limit, and actual ambient monitoring results showed that the modeling was under-predicting air concentrations, MPCA determined that rounding of the endpoint-refined hazard index was not sufficiently protective in this situation. Furthermore, Water Gremlin modified the MPCA RASS to include a toxicity value outside of the MPCA hierarchy, and therefore MPCA has developed a corrected RASS that follows MPCA guidance based on all other data provided by Water Gremlin. MPCA determined the emission rate of t-DCE in an un-modified MPCA RASS so that the final endpoint-refined hazard index was 1.00. These MPCA's corrected RASS t-DCE emission rates were 37.5 tons per year at STRU 73 and 38.7 for the total facility. MPCA's corrected RASS is included in Attachment 1.a.

However, after the MPCA analyzed Water Gremlin's actual ambient air monitoring results for t-DCE and the corresponding t-DCE usage records, the MPCA compared these to the predictions from the MPCA's corrected RASS. It was based on this comparison that the MPCA concluded the air dispersion modeling and corrected MPCA RASS for t-DCE was under-predicting actual impacts on ambient air concentrations of t-DCE. Therefore, MPCA determined that consideration of the reported daily t-DCE solvent use and ambient air measurements of t-DCE needed to be included in setting the t-DCE limit. The MPCA aligned the individual ambient air monitoring results with reported daily use of solvent from Water Gremlin. The ambient air measurements of t-DCE bracket 20.0 ug/m^3 (the MDH chronic health benchmark for t-DCE) at an annual use of 32.6 tons per year as shown below.

Site	Sample Date	Pollutant	Rolling Mean (ug/m3)	365 Day Rolling Total (tons)
W	10/25/2021	Trans-1,2-Dichloroethylene	19.81	32.57
W	10/28/2021	Trans-1,2-Dichloroethylene	19.82	32.52
W	10/31/2021	Trans-1,2-Dichloroethylene	19.82	32.50
W	11/3/2021	Trans-1,2-Dichloroethylene	19.87	32.60
W	**11/6/2021**	**Trans-1,2-Dichloroethylene**	**19.98**	**32.59**
W	**11/9/2021**	**Trans-1,2-Dichloroethylene**	**20.42**	**32.64**
W	11/12/2021	Trans-1,2-Dichloroethylene	20.42	32.60
W	11/18/2021	Trans-1,2-Dichloroethylene	20.98	32.60
W	11/21/2021	Trans-1,2-Dichloroethylene	20.98	32.44
W	11/30/2021	Trans-1,2-Dichloroethylene	20.71	32.42
W	12/3/2021	Trans-1,2-Dichloroethylene	20.71	32.40
W	12/6/2021	Trans-1,2-Dichloroethylene	20.62	32.42
W	12/9/2021	Trans-1,2-Dichloroethylene	20.62	32.39
W	12/12/2021	Trans-1,2-Dichloroethylene	20.62	32.45
W	12/15/2021	Trans-1,2-Dichloroethylene	20.60	32.56
W	12/18/2021	Trans-1,2-Dichloroethylene	20.60	32.55
W	12/21/2021	Trans-1,2-Dichloroethylene	20.59	32.48
W	12/27/2021	Trans-1,2-Dichloroethylene	20.84	32.27
W	12/29/2021	Trans-1,2-Dichloroethylene	20.72	32.21

Therefore, after considering all the evidence, not just modeling and the MPCA corrected RASS, the MPCA staff recommend that Water Gremlin be limited at a total facility level at 32.6 tons per year to protect public health and ensure the facility did not exceed the health benchmark limit of 20.0 ug/m^3. Although 32.6 tons per year is approximately 16 percent lower than the modeled result, it isappropriate

Commented [A47]: No limit had been established

Commented [A48]: There are many reasons ambient monitoring results would be higher than modeled results, including contamination from other sources beyond the facility. This is one reason that it is established practice to use modeling and emission levels to determine the facility's impact on ambient air.

Commented [A49]: Minn. R. 4717.8600 defines the limit as 1, not 1.0 or 1.00.

Commented [A50]: See petition for contested case hearing and comment letter.

based on the weight of the evidence provided by actual ambient air measured concentrations of t-DCE around the facility and the associated t-DCE usage at the facility. It must be noted there are no other known sources of t-DCE around the Water Gremlin facility other than Water Gremlin itself.

The MPCA has followed a weight of evidence approach in this risk management decision pertaining to monitoring and the recommended permit limit of at 32.6 tons per year, as follows:

1) Ambient measurements (t-DCE) are close to the MDH RAA - At the current t-DCE use rate of between 29 and 35 tons annually, 365-day rolling average ambient measurements at the Water Gremlin facility are at or exceeding the MDH chronic health benchmark of 20 µg/m3. (*https://www.pca.state.mn.us/air/water-gremlin-air-monitoring*)

2) Other on-site sources of t-DCE - The charts on the Water Gremlin air monitoring webpage represent only the t-DCE use in coating rooms, and do not reflect other *t*-DCE air emissions that are emitted at the site (evaporation loses to indoor air outside the coating rooms, remediation stack). These other onsite air emissions encompass about 1-1.5 tons per year of t-DCE. The calculations of t-DCE use in coating rooms do not take into account the t-DCE that is present in waste leaving the facility, this information has not been provided with the permit application.

3) Multiple sources of information - The facility is operating near the proposed total facility permit limit. The current air dispersion modeling efforts for the t-DCE recommended limit, and near their current use, are under-to-accurately predicting the ambient air measurements at the fence line.

4) Chronic (long term) RAA matches planned facility operation - The MDH defines a chronic (long term) exposure as over 8 years or over approximately 10 percent of a person's lifetime. MPCA is using the chronic inhalation health benchmark since the permit will be issued for Water Gremlin to operate into the future. (*https://www.health.state.mn.us/communities/environment/risk/docs/guidance/air/tdecinfo.pdf*) (*https://www.health.state.mn.us/communities/environment/risk/docs/guidance/air/airdurations.pdf*)

5) Community concerns - MPCA has received many community requests that MPCA consider past potential trichloroethylene (TCE) exposures in analyses that inform the permit. MPCA has no direct way to account for potential past exposures of TCE in current AERA practices. Therefore, it is prudent that we apply the most health-protective exposure duration (chronic), particularly since the MDH Air Guidance Values for both TCE and t-DCE were developed based on the same sensitive health endpoint of impacts to the immune system.

6) Consistent MPCA practices - In May 2020, the Minnesota legislature passed a partial ban of trichloroethylene use by permitted sources. Part of the legislation requires that TCE replacements be less toxic to human health than TCE. The MDH RAA for t-DCE supports this work. The use of this RAA from MDH is also consistent with the MPCA AERA program, it is not a facility-specific value. (*https://www.health.state.mn.us/communities/environment/risk/docs/guidance/air/tdcesumm.pdf*)

Commented [A56]: See petition for contested case hearing and comment letter.

3.7 Ambient air boundary

During the air dispersion modeling analysis, the Permittee omitted receptors on portions of the facility property. These portions of the atmosphere that may be accessible to the public within the facility property must be excluded from public access (ambient air). The Permittee maintains security fencing along the entire facility perimeter and a controlled access gate. This fence line defines the ambient air boundary used for siting receptors in the air dispersion modeling analysis. The MPCA has determined that the existing security fencing is sufficient to establish an ambient air boundary, based on guidance contained in the 1980

letter from the US Environmental Protection Agency (EPA) Administrator Douglas Costle to Senator Jennings Randolph and the March 28, 2017 MPCA Memorandum "Clarification of MPCA Working Practice to Evaluate the Federal Definition of Ambient Air in Air Quality Dispersion Modeling."" (Appendix D to MPCA Air Dispersion Modeling Practices Manual). This determination is also consistent with the US EPA December 2019 Draft "Revised Policy on Exclusions from 'Ambient Air'." This permit requires the Permittee to comply with a general public preclusion plan, which must be maintained onsite. The Permittee must document any security breaches, as well as identify any security deficiencies and update the Plan accordingly to prevent future breaches. Appendix G to the permit includes a map depicting the ambient air boundary.

3.8 Paired sub-slab and indoor air testing

The Administrative Order executed January 17, 2020, required the Facility conduct paired sub-slab and indoor air testing as a condition for re-starting VOC coating operations. This data will be compared against future test data to determine if VOCs are migrating through the concrete floor. Indoor air samples obtained were tested for a variety of air toxics (EPA Method TO-15) and their respective concentrations reported, in micrograms per cubic meter ($\mu g/m^3$), based on method detection limits (MDLs). If concentrations of chemicals were detected above MDLs, their emission rates were calculated based upon the detected concentrations. For chemicals not detected based on the assumed MDL, emission rates for those chemicals were calculated using the MDL. These emissions were characterized in the AERA by assuming they are emitted through building ventilation systems based on the ventilation rate through the building vent associated with the room whose indoor air was tested.

Commented [A57]: There is no longer need for this indoor air sampling. The agency has multiple years of data and the permanent vapor mitigation system has been installed. These requirements should be terminated.

3.9 Ambient air monitoring

The March 1, 2019, Stipulation Agreement required the facility to conduct ambient air monitoring to determine ambient concentrations VOCs (TO-15), including TCE and t-DCE, around the facility and adjacent properties in order to demonstrate emissions from the facility do not pose an unacceptable risk to human health. The facility prepared and submitted an Ambient Air Monitoring Plan in general accordance with United States Environmental Protection Agency (EPA), Air/Superfund National Technical Guidance Series, Volume IV – Guidance for Ambient Air Monitoring at Superfund Sites (Revised), EPA-451/R-93-007, 1993, and MPCA's Exhibit M.

- **Ambient monitoring pre-permit issuance**

  The ambient air monitoring plan required by the Stipulation Agreement was approved by the MPCA and operation of the monitoring network began March 1, 2019, including five (5) ~~VOC~~ monitors operated by the facility. MPCA independently operated two (2) VOC and two (2) lead monitoring sites in response to community concerns about VOC exposure for vulnerable populations.

- **Ambient monitoring post-permit issuance**

  VOC and t-DCE

  Continued ambient monitoring of VOC and t-DCE concentrations around the facility is required to by the permit demonstrate continuous compliance with the t-DCE health benchmark value. VOC (TO-15) ambient monitoring enables detection of deviations from the expected emissions profile from the facility. The permit requires the facility to monitor according to the Ambient Air Monitoring Plan implemented as a result of the 2019 Stipulation Agreement (Attachment 5).

  Commented [A58]: The tDCE limit is RAA, not HBV. It was not promulgated and has not been through peer review or public comment.

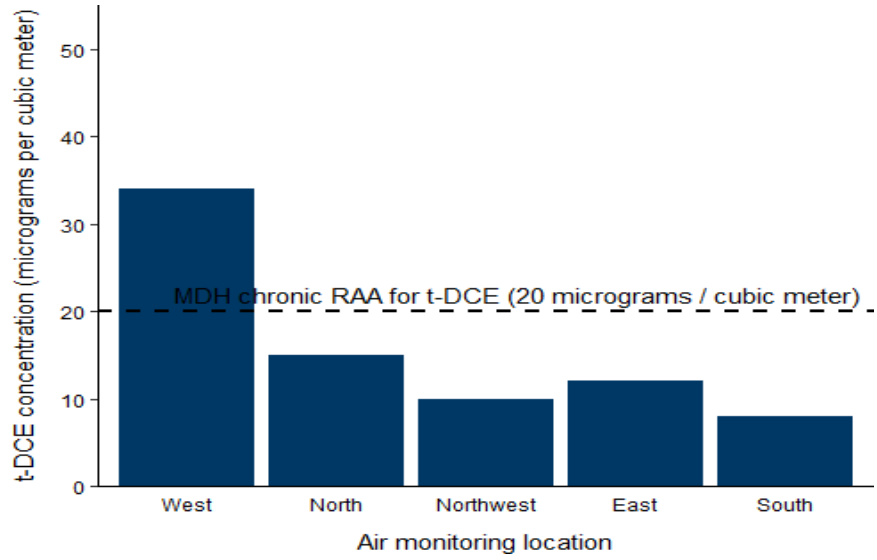
  Commented [A59]: Unnecessary and outside agency norms for facilities.

  The permit allows Water Gremlin to revise the VOC and t-DCE ambient monitoring plan in accordance with MPCA recommendations for acceptable reduction in ambient monitoring requirements. The MPCA's air monitoring staff recommendations for a revised t-DCE and VOC ambient monitoring plan are based on analysis of ambient monitoring data collected from March 1, 2019, to August 1, 2020, to determine if ambient monitoring requirements could be adjusted to align with standard MPCA practices. Based on the analysis, MPCA air monitoring staff recommends the following:

1) Maintain the two (2) monitors located at the West and North sites meeting the following EPA siting requirements:
    a. Permanent site
    b. Mass flow controller
    c. Install platforms
    d. Improve monitoring site security

Monitoring results consistently show the West and North monitoring sites measuring the highest t-DCE and TCE concentrations on average (Figures 4 and 5). These two sites provide a "worst-case scenario" of ambient air t-DCE and TCE concentrations surrounding the facility. Based on these results, t-DCE and TCE concentrations at the other sites are not expected higher on average than t-DCE and TCE concentrations measured at the West and North sites. Therefore, maintaining the West and North sites meeting EPA siting requirements and discontinuing the other VOC monitoring sites will continue to provide representative measurements on ambient t-DCE concentrations around the facility.

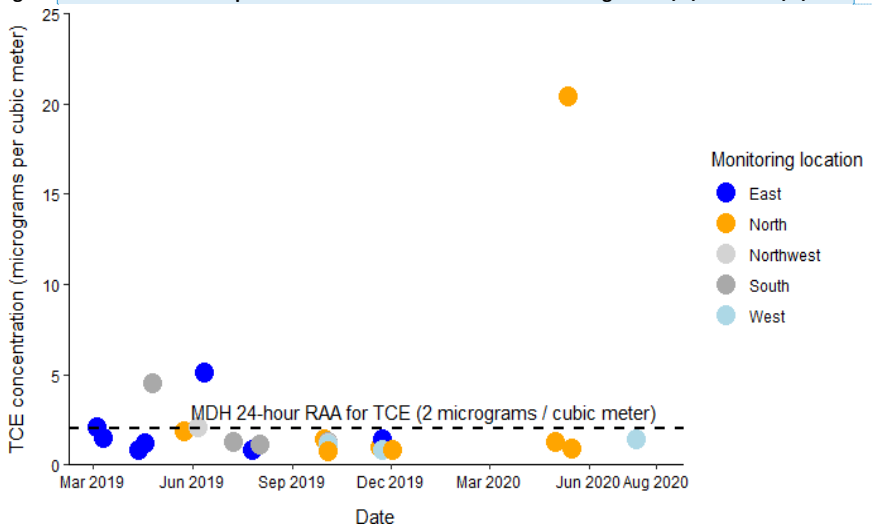
Figure 4: Average t-DCE concentrations at Water Gremlin monitoring sites 3/1/2019 to 8/1/2020



Commented [A60]: Remove references to TCE. TCE is not used by or stored at the facility. Detections of TCE in the ambient monitors have been rare and evaluated. The conclusions of the evaluations have been that the TCE is not originating from the facility. This points to outside influences on the monitors and supports removal of the monitors and reliance upon the model and tracking of usage against a facility limit so these outside influences are not confounding results.

Commented [A61]: This timeframe is not relevant to the current permit period.

Figure 5: Detected TCE sample results at Water Gremlin air monitoring sites 3/1/2019 to 8/1/2020



Commented [A62]: Water Gremlin provided an evaluation showing that the TCE detections were not from the facility. This chart is misleading.

2) Reduce sampling frequency from once every three (3) days to once every six (6) days when coating operations are occurring. Average ambient air concentrations measured around the facility during coating operations once every six days are about the same as average concentrations measured once every three days and the facility's t-DCE throughput (and emissions) do not vary greatly on a day-to-day basis. Therefore, reducing the sampling frequency from once every three days to once every six days would make the facility's sampling schedule consistent with MPCA's VOC air sampling schedule without compromising the representativeness of the measurements.

3) Submit all monthly TO-15 results to MPCA directly from the third-party laboratory within 30 days after the last day of the month. Since t-DCE is a pollutant with potential risks primarily associated with long-term exposure, it is generally not necessary to receive monitoring results within days. It is more important to focus on long-term average concentrations and trends instead of day-to-day monitoring results. Monthly results submissions would suffice for evaluating potential health risks associated with t-DCE exposure and notifying the community of any potential health risks in an appropriate amount of time. This would reduce the frequency which new information is reported to the public, but all monitoring results will still be made publicly available as needed.

4) MPCA Environmental Data Quality Unit may annually review and request amendments.
The facility shall include all of the information above, including monitoring locations, sampling frequency and duration, data submittal process, and a quality assurance project plan (QAPP) in their air monitoring plan. The monitoring plan is not valid until approved by the MPCA Environmental Data Quality Unit. Once the monitoring plan is approved, the facility is expected to operate an air monitoring network and submit results to MPCA in accordance with the monitoring plan. The monitoring plan may be reviewed annually by the MPCA Environmental Data Quality Unit and MPCA may request amendments to the air monitoring plan after review.

<u>Lead</u>
MPCA's ambient monitoring staff conducted an analysis of ambient air measurements during the period between September 18, 2019, and January 29, 2022, and concluded the MPCA operated lead monitoring

sites may be removed. The Agency further concluded the facility may demonstrate compliance with the lead NAAQS through either air dispersion modeling or ambient air monitoring described in the MPCA's industrial monitoring process. Once the facility demonstrated compliance with the lead NAAQS through either modeling ~~or monitoring~~, the MPCA lead monitoring sites were deemed redundant and were discontinued. Accordingly, the permit does not require continuation of ambient monitoring for lead.

3.9.2. Discontinuation of VOC ambient air monitoring after permit issuance

In addition to the option for a revised ambient air monitoring plan with reduced requirements, MPCA staff also developed conditions in which the facility may discontinue ambient air monitoring around the facility. These conditions were developed based on EPA's Ambient Air Monitoring Network Assessment Guidance and MPCA's Development of an air quality monitor siting plan for determination of compliance best practices. The conditions for discontinuation of t-DCE and VOC ambient monitoring are included in the permit and will be implemented upon review and approval from MPCA. These recommendations include:

1) Two years of ambient air monitoring is conducted after an ambient air monitoring plan is approved by MPCA and implemented after the permit issuance date;
2) There are no violations of the permit or operations shut down within that year;
3) The facility's 1,2-(trans-) Dichloroethylene emissions are at least 80 percent of the permitted limit during the ambient air monitoring period or less than 50 percent of the permitted limit; and
4) The probability of future long-term average 1,2-(trans-) Dichloroethylene concentrations being above health guidelines is less than 5 percent.

3.10 Flexibility to modify, replace, or add new battery terminal post coaters

The Permittee wants flexibility to convert VOC coaters to UV coating technology, and the Permittee has asked for flexibility to convert VOC coaters and install more water-based coaters without applying for a major amendment. MPCA supports flexibility for this purpose. Table 8 summarizes the flexibility provided by the permit that would allow and prohibit (without a major amendment) conversion or replacement of existing coaters, or addition of new coaters.

Table 8. Summary of flexibility allowed by the permit

Coating type and application method	YES to convert to OR replace with	NO to convert to OR add coaters	Comment
VOC dip/drip	• Water-based dip/drip • Water-based spray • UV spray	• Larger capacity VOCdip/drip • VOC spray	Modeling accounts for replacement and addition of new UV coaters or other new sources of PM/PM_{10}/$PM_{2.5}$ (i.e. water-based spray). Addition or increase in capacity for VOC coaters, or increase in PM/PM_{10}/$PM_{2.5}$ potential emissions, would need further permit evaluations.
VOC spray	• Water-based dip/drip • Water-based Spray • VOC dip/drip of equal of lower size • VOC spray of equal or lower size • UV spray	• Larger capacity VOC spray • Larger capacity dip/drip VOC	Modeling accounts for replacement and addition of new UV coaters or other new sources of PM/PM_{10}/$PM_{2.5}$ (i.e. water-based spray). Addition or increase in capacity for VOC coaters, or increase in PM/PM_{10}/$PM_{2.5}$ potential emissions, would need further permit evaluations.
Water-based dip/drip	• Water-based spray • Water-based dip/drip	• VOC dip/drip • VOC spray	Modeling accounts for replacement and addition of new UV coaters or other new

Commented [A63]: MPCA already has ample data.

Commented [A64]: Vague requirement – what constitutes a violation of the permit? Any deviation? Disingenuous condition when the permit includes a condition to correlate tracked usage with the in-stack monitor, set at a correlation to show deviations 5% of the time.

Commented [A65]: It is counterintuitive and counterproductive to require a high level of usage emissions in order to discontinue monitoring, when the facility has stated its long-term plans to increase UV coating and reduce solvent coating. The trigger for discontinuing ambient monitoring should be tied to reduced VOC-based coating usage. It is illogical to encourage high usage rather than low usage as the company moves away from VOC-based coating.

Commented [A66]: See petition for contested case hearing and comment letter.

Commented [A67]: There are no PM emissions from dip/drip coaters, so converting VOC spray to a larger capacity VOC dip/drip coater should be allowed.

	• UV spray		sources of PM/PM_{10}/$PM_{2.5}$ (i.e. water-based spray). Addition or increase in capacity for VOC coaters, or increase in PM/PM_{10}/$PM_{2.5}$ potential emissions, would need further permit evaluations.
Water-based spray	• Water-based dip/drip • ~~Water-based spray~~ • UV spray	• VOC dip/drip • VOC spray	Modeling accounts for replacement and addition of new UV coaters or other new sources of PM/PM10/PM2.5 (i.e. water-based spray). Addition or increase in capacity for VOC coaters, or increase in PM/PM_{10}/$PM_{2.5}$ potential emissions, would need further permit evaluations.
UV spray	• Water-based dip/drip • Water-based spray • UV spray	• VOC dip/drip • VOC spray	Modeling accounts for replacement and addition of new UV coaters or other new sources of PM/PM_{10}/$PM_{2.5}$ (i.e. water-based spray). Addition or increase in capacity for VOC coaters, or increase in PM/PM_{10}/$PM_{2.5}$ potential emissions, would need further permit evaluations.

Appendix B to the permit contains an inventory of the coating type and application method allowed at the time of permit issuance. The permit requires that the inventory be updated whenever coater is modified, added, or replaced as allowed by the permit.

3.11 Monitoring

In accordance with the Clean Air Act, it is the responsibility of the owner or operator of a facility to have sufficient knowledge of the facility to certify that the facility is in compliance with all applicable requirements.

In evaluating the monitoring included in the permit, the MPCA considered the following:

- The likelihood of the facility violating the applicable requirements.
- Whether add-on controls are necessary to meet the emission limits.
- The variability of emissions over time.
- The type of monitoring, process, maintenance, or control equipment data already available for the emission unit.
- The technical and economic feasibility of possible periodic monitoring methods.
- The kind of monitoring found on similar units elsewhere.

The table below summarizes the monitoring requirements associated with this amendment.

Table 9. Monitoring

Subject item*	Requirement (rule basis)	What is the monitoring	Why is this monitoring adequate?
COMG 1 (VOC and 1,2 (trans) Dichloroethylene Limits and VOC Coater, Water-Based Coater, UV Coater, and Solvent Distillation Operation Requirements)	VOC <= 90.0 tons/yr 12-month rolling sum [Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and 40 CFR 70.2]	Recordkeeping: Daily records of coating usage; purchase records of solvent; on-going records of coating contents; monthly calculations of emissions; continuous emissions monitoring; ambient monitoring	Records can be generated on a daily basis with a combination of daily usage logs, and calculation of monthly emissions and 12-month rolling sums. Material content for each material must be determined as required by the Material Content requirement at COMG 1. CEMS will ensure reliability of recordkeeping of usage in the coating rooms and ambient monitoring will provide information on the concurrence with emissions trends to ensure the t-DCE HBV is not exceeded. Credit can be taken for waste materials collected and shipped off-site (usage - waste = emissions).
	1,2-(trans) Dichloroethylene <= 32.6 tons/yr 365-day rolling sum [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]	Recordkeeping: Daily records of t-DCE coating usage; t-DCE containing material recovered from the distiller and exiting the facility in waste; on-going records of t-DCE content in coatings, used solvent and waste; daily calculations of emissions; Continuous emissions monitoring; ambient monitoring. Quarterly t-DCE purchase and inventory audit	Records can be generated on a daily basis with a combination of daily usage logs, and calculations of daily emissions and 365-day rolling sums. Material content for each material must be determined as required by the Material Content requirement at COMG 1. CEMS will ensure reliability of recordkeeping of VOC usage in the coating rooms and ambient monitoring will provide information on the concurrence with emissions trends and ensure the t-DCE HBV is not exceeded. Credit can be taken for waste materials collected and shipped off-site (usage - waste = emissions).
COMG 5 (Coating Room Requirements)	Pressure Drop <= -0.007" H_2O [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]	Recordkeeping: CPMS; alarms; performance testing	Continuous Parameter Monitoring System (CPMS) will continuously monitor pressure drop across each entrance, each with an alarm that sounds when pressure drop is above the set point.

Commented [A68]: See petition for contested case hearing and comment letter.

Commented [A69]: See prior discussion regarding CEMS.

Commented [A70]: Setting requirements from a NESHAP the facility is not subject to is unnecessarily burdensome.

Subject item*	Requirement (rule basis)	What is the monitoring	Why is this monitoring adequate?
COMG 6 (Indirect Heating Equipment Rule Requirements)	PM <= 0.40 lb/MMBtu Opacity <= 20.0% [Minn. R. 7011.0515]	Recordkeeping: monthly fuel records	All units use natural gas; therefore, the likelihood of violating either of the emission limits is very small. The Permittee can demonstrate that these units will continue to operate such that emissions are well below the emission limits by only burning natural gas. Design based PTE for each unit, using AP-42, is 0.0075 lb/MMBtu of PM compared to the rule limit of 0.4 lb/MMBtu of PM.
COMG 7 (Industrial Process Equipment Rule Requirements)	PM <= 0.30 gr/dscf Opacity <= 20% [Minn. R. 7011.0715]	None	Applicable rule limits are above calculated potential to emit based on maximum throughput and airflow.
COMG 10 (NOx: North Building Space Heating and Operation Limits)	Heat Input <= 10.~~68~~ 69 MMBtu [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]	Heating unit inventory and recordkeeping	The permit requires the facility to keep an up-to-date inventory of all space heating units. These records must be available for MPCA inspection.
	PM < 10 micron <= 0.07966 pounds per hour 3-hour average PM < 2.5 micron <= 0.07966 pounds per hour 3-hour average Nitrogen Oxides <= 1.0482 pounds per hour 3-hour average Lead <= 0.000005 pounds per hour 3-hour average [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]	None	Emissions from units in COMG 10 were modeled at their maximum capacity. No further monitoring is required.

Subject item*	Requirement (rule basis)	What is the monitoring	Why is this monitoring adequate?
COMG 11 (HEPA Filter and Electrostatic Precipitator Control Equipment Train - Melt Pots)	PM >= 97.0 percent control efficiency PM10 >= 97.0 percent control efficiency PM2.5 >= 97.0 percent control efficiency Lead >= 86.0 percent control efficiency [Avoid a major source under Part 70.2, Minn. R. 7007.0800, subp. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]	Daily and periodic inspections, operation and maintenance, corrective actions, performance testing, and recordkeeping.	Monitoring based on the Minnesota Performance Standard for Control Equipment is adequate to have a reasonable assurance of compliance.
COMG 12 (HEPA Filter and Electrostatic Precipitator Control Equipment Train – Die Casting)	PM >= 86.6 percent control efficiency PM10 >= 86.6 percent control efficiency PM2.5 >= 86.6 percent control efficiency [Avoid a major source under Part 70.2, Minn. R. 7007.0800, subp. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]	Daily and periodic inspections, operation and maintenance, corrective actions, performance testing, and recordkeeping.	Monitoring based on the Minnesota Performance Standard for Control Equipment is adequate to have a reasonable assurance of compliance.
COMG 13 (Direct Heating Equipment Rule Requirements)	PM <= 0.30 gr/dscf Opacity <= 20% [Minn. R. 7011.0610, subps. 1(A)(1) & (2)]	Recordkeeping: fuel records	These units use natural gas only; therefore, the likelihood of violating either of the emission limits is very small. The Permittee can demonstrate that these units will continue to operate such that emissions are well below the emission limits by only burning natural gas.

Subject item*	Requirement (rule basis)	What is the monitoring	Why is this monitoring adequate?
COMG 14 (HEPA Filters – Spray Coaters)	PM >= 99.98% control efficiency PM < 10 micron >= 99.98% control efficiency PM < 2.5 micron >= 99.90% control efficiency [Avoid a major source under Part 70.2, Minn. *Location of the requirement in the permit (e.g., EQUI 1, STRU 2, etc.).

3.12 Insignificant activities

Water Gremlin Co has several operations which are classified as insignificant activities under the MPCA's permitting rules. These are listed in Appendix A to the permit. The following insignificant activities are included in this modification.

Table 10. Insignificant activities

Insignificant activity	General applicable emission limit	Discussion
Brazing, soldering, torch-cutting, or welding equipment	PM, variable depending on airflow Opacity <= 20% (Minn. R. 7011.0715)	For these units, based on EPA published emissions factors, it is highly unlikely that they could violate the applicable requirement. In addition, these units are typically operated and vented inside a building, so testing for PM or opacity is not feasible. (Welding)
Individual units with potential emissions less than 2000 lb/year of certain pollutants	PM, variable depending on airflow Opacity <= 20% (Minn. R. 7011.0715)	For these units, based on EPA published emissions factors, it is highly unlikely that they could violate the applicable requirement. In addition, these units are typically operated and vented inside a building, so testing for PM or opacity is not feasible. (Parts washer)

3.13 Permit organization

In general, this permit meets the MPCA Tempo Guidance for ordering and grouping of requirements as well as the use of permit appendices. However, federal requirements from NSPS are included in a different format from past permits. For these rules, limits and submittal/actions from 40 CFR pt. 60, subp. IIII are included individually in the permit like the other standards. For the remaining portions of the rule and the associated General Provisions in 40 CFR pt. 60, subp. A, a requirement in Section 5 of the permit lists the citations of all of the applicable parts of the standard along with a reference to the permit appendix where the full text of the standard is included. Copies of each standard written in this format are included in Appendices H and I, respectively.

3.14 Comments received

Public Notice Period: [start date] – [end date]
EPA Review Period: [start date] – [end date]

4. Permit fee assessment

Attachment 3 to this TSD contains the MPCA's assessment of Application and Additional Points used to determine the permit application fee for this permit action as required by Minn. R. 7002.0019. The permit action includes three permit applications, of which include the incorporation of applicable NSPS and NESHAP standards, limits to avoid PSD and Part 70 regulations, NAAQS modeling, and an AERA. Each of these are chargeable activities under the rule and are summarized in Attachment 3.

5. Conclusion

Based on the information provided by Water Gremlin Co the MPCA has reasonable assurance that the proposed operation of the emission facility, as described in the Air Emission Permit No. 12300341-101 and this TSD, will not cause or contribute to a violation of applicable federal regulations and Minnesota Rules.

Staff members on permit team: Jacobe Timler (permit engineer)
Jeffrey Hedman (peer reviewer)

Megumi Muramoto-Mathieu (permit engineer)
David Brown (risk evaluation and air modeling)
Kristie Ellickson (environmental analysis and outcomes)
Jennifer Carlson (air compliance and enforcement)
Mark Severin (stack testing)
Katie Rinker (environmental data quality)
Michael Smith (environmental data quality supervisor)
Michael Ginsbach (remediation)
Michael Rynders (hazardous waste)
Carolina Schutt (air permitting unit supervisor)
Toni Volkmeier (air permitting unit supervisor)
Steve Pak (air permitting section manager)
Cory Boeck (air compliance section manager)
Timothy Grape (remediation supervisor)
Beckie Olson (permit writing assistant)
Joe Handtman (document coordinator)
Laurie O'Brien (administrative support)

Tempo Activities: Administrative Amendment (IND20160001), Major Amendment (IND20180001), Major Amendment (IND20190001), Notification of Installation of Controls (IND20210001)

Model Input Key

Parameters	Units	Description
Permit ID		ID given in Permit or contact MPCA permit engineer
AERMOD ID		3-character facility ID plus Stack Vent or POINT source ID used in Modeling (up to 8 characters), e.g. FACSV001
Pollutant		Criteria pollutant modeled, PM2.5, PM10, SO2, NO2, CO, Pb, O3
Averaging time		Modeling Period for pollutant, 1-HR, 24-HR, Annual, etc.
Operating scenario	[#]	A number indicating the operating condition, described in the Emission Calculations tab, for which the emission rate will be modeled.
Scalar/Variable emissions_type		By Season (SEASON); By Month (MONTH); By Hour-of-Day (HROFDY); By Wind Speed (W SPEED); By Season/Hour (SEASHR); By Season/Hour/Day (SHRDOW); By
Release type =		Release type parameter specified on the SO LOCATION card. Use POINT for vertical, POINTCAP for capped, or POINTHOR for horizontal releases.
X and Y	[m]	Stack Coordinates in UTM NAD83, zone 15 extended ONLY
Base_Elev =	[m]	Source base elevation above mean sea level
Emission_Rate =	[g/s]	Emission rate (g/s)
Height =	[m]	Release height above ground
Exit_Temp =	[K]	temperature.
Exit_Vel =	[m/s]	Stack exit velocity. For capped and horizontal releases, this value should be set as if the stack was a non-capped vertical release.
Diam =	[m]	Stack diameter or equivalent diameter
Flow Rate =	[ACFM]	Flow rate of stack
Desc =		Stack description (boiler, furnace, etc)
SO EMISFACT Description		Scalar/Variable emissions description

AQDM-02

Air Quality Dispersion Modeling (AQDM) protocol spreadsheet

(Previously AQDMPS-01)

Doc Type: Air Dispersion Modeling

Note: Permit applicants may create their own spreadsheet tabs.

AQ Facility ID number:	12300341
Facility name:	Water Gremlin Company
Facility address:	4400 Otter Lake Road
Facility contact:	Mary Gail Scott

Model Input Key

Parameters	Units	Description
Permit ID		ID given in Permit or contact MPCA permit engineer
AERMOD ID		3-character facility ID plus AREA source ID used in Modeling (up to 8 characters), e.g. FACFS001
Pollutant		Criteria pollutant modeled, PM2.5, PM10, SO2, NO2, CO, Pb, O3
Averaging time		Modeling Period for pollutant, 1-HR, 24-HR, Annual, etc.
Operating scenario	[#]	A number indicating the operating condition, described in the Emission Calculations tab, for which the emission rate will be modeled.
Scalar/Variable emissions_type		By Season (SEASON); By Month (MONTH); By Hour-of-Day (HROFDY); By Wind Speed (WSPEED); By Season/Hour (SEASHR); By Season/Hour/Day (SHRDOW); By Season/Hour/Seven Days (SHRDOW7); By Month/Hour/Day (MHRDOW); By Month/Hour/Seven Days (MHRDOW7); By Hour/Seven Days (HRDOW7); By Hour/Day (HRDOW)
X1 =	[m]	X coordinate of source location [m] Enter here the X coordinate for the vertex of the area source that occurs in the southwest quadrant of the source.
Y1 =	[m]	Y coordinate of source location [m] Enter here the Y coordinate for the vertex of the area source that occurs in the southwest quadrant of the source.
Base_Elev =	[m]	Source base elevation above mean sea level
Emission_Rate =	[g/s/m2]	Emission rate (g/s for POINT, POINTCAP, POINTHOR, and VOLUME; g/s/m^2 for AREA, AREAPOLY, AREACIRC, and OPENPIT)
Height =	[m]	Release height above ground
Length_X =	[m]	X side length of the AREA
Length_Y =	[m]	Y side length of the AREA
Rotation angle	[deg]	
SigmaZ =	[m]	Initial sigma Z (optional for all AREA)
Num_Coords =		Number of coordinate pairs (POINT = 1, VOLUME = 1, OPENPIT = 1, AREA = 1, AREA_CIRC = 1, AREA_POLY >= 3)
Desc =		Optional description
SO EMISFACT Description		Scalar/Variable emissions description

Notes:

1. Release height is equal to the height of the building

2. Volume Source Characterization from AERMOD User Guide

Type	Int Lateral Dimen.	Int Vertical Dimen.
Volume 1	Single Source **Length/4.3**	Surface Based **Vertical dim/2.15**
Volume 2	Single Source **Length/4.3**	Elevated on or adjacent to a structure **Structure height/2.15**
Volume 3	Single Source **Length/4.3**	Elevated not on or adjacent **Vertical dim/4.3**

LEAD-CO	Lead Compounds											
58-89-9	Lindane (all isomers)											
108-31-6	Maleic anhydride											
7439-96-5	Manganese		9.3E-07	4.08E-06			8.54E-07	3.74E-06	3.98E-06	1.74E-05		
MANGANE	Manganese Compounds											
7439-97-6	Mercury (elemental)		6.4E-07	2.79E-06			5.84E-07	2.56E-06	2.73E-06	1.19E-05		
MERCURY	Mercury Compounds											
126-98-7	Methacrylonitrile											
67-56-1	Methanol											
109-86-4	Methoxyethanol, 2- (ethylene glycol monomethyl ether EGME)											
96-33-3	Methyl acrylate											
110-49-6	Methyl Cellosolve Acetate											
74-87-3	Methyl chloride (Chloromethane)											
71-55-6	Methyl chloroform (1,1,1-Trichloroethane)											
78-93-3	Methyl ethyl ketone (2-Butanone)											

CAS # or MPCA #	Chemical Name	0 FAN13		STRU56 FAN14		STRU57 VENT20		SBLDGIA		NBLDGIA		STRU67 Fan 30

60-34-4	Methyl Hydrazine												
108-10-1	Methyl isobutyl ketone (Hexone)												
624-83-9	Methyl isocyanate												
80-62-6	Methyl methacrylate												
1634-04-4	Methyl tert butyl ether												
56-49-5	Methylcholanthrene, 3-												
3697-24-3	Methylchrysene, 5-												
101-14-4	Methylene bis(2-chloroaniline), 4,4-												
74-95-3	Methylene Bromide												
75-09-2	Methylene chloride (Dichloromethane)												
101-68-8	Methylene diphenyl diisocyanate (MDI)												
101-77-9	Methylenedianiline, 4,4-												
90-94-8	Michler's ketone												
10595-95-6	N- Nitrosomethylethylamine												
924-16-3	N-Nitrosodi-n-butylamine												
621-64-7	N-Nitrosodi-n-propylamine												
55-18-5	N-Nitrosodiethylamine												
62-75-9	N-Nitrosodimethylamine												
86-30-6	N-Nitrosodiphenylamine												
59-89-2	N-Nitrosomorpholine												
100-75-4	N-Nitrosopiperidine												
111-84-2	N-Nonane												
64724-95-6	Naphtha, High Flash Aromatic (HFAN)												
91-20-3	Naphthalene		1.5E-06	6.55E-06			1.37E-06	6.01E-06	6.39E-06	2.8E-05			
193-09-9	Naphtho[2,3-e]pyrene												
7440-02-0	Nickel		5.2E-06	2.26E-05			4.72E-06	2.07E-05	2.2E-05	9.64E-05			
NICKEL-C	Nickel Compounds												
1313-99-1	Nickel oxide												
0-02-5	Nickel refinery dust from the pyrometallurgical process												
12035-72-2	Nickel sulfide (NI3S2)												
7697-37-2	Nitric acid												
139-13-9	Nitrilotriacetic acid												
18662-53-8	Nitrilotriacetic acid, trisodium salt monohydrate												
602-87-9	Nitroacenaphthene, 5-												
88-74-4	Nitroaniline, 2-												
100-01-6	Nitroaniline, 4-												
98-95-3	Nitrobenzene												
7496-02-8	Nitrochrysene, 6-												
607-57-8	Nitrofluorene, 2-												
10102-44-0	Nitrogen dioxide (NO2)		0.24528	1.074309			0.224804	0.984641	1.048205	4.59114			
75-52-5	Nitromethane

79-46-9	Nitropropane, 2-												
5522-43-0	Nitropyrene, 1-												
57835-92-4	Nitropyrene, 4-												
156-10-5	Nitrosodiphenylamine, p-												
3268-87-9	Octachlorodibenzo-p-dioxin, 1,2,3,4,6,7,8,9-												
39001-02-0	Octachlorodibenzofuran, 1,2,3,4,6,7,8,9-												
10028-15-6	Ozone												
74472-37-0	PCB 114 (2,3,4,4,5 Pentachlorobiphenyl)												
31508-00-6	PCB 118 (2,3,4,4,5 Pentachlorobiphenyl)												
65510-44-3	PCB 123 (2,3,4,4,5 Pentachlorobiphenyl)												
57465-28-8	PCB 126 (3,3,4,4,5 Pentachlorobiphenyl)												
38380-080	PCB 156 (2,3,3,4,4,5 Hexachlorobiphenyl)												
69782-90-7	PCB 157 (2,3,3,4,4,5 Hexachlorobiphenyl)												
52663-72-6	PCB 167 (2,3,4,4,5,5 Hexachlorobiphenyl)												
32774-16-6	PCB 169 (3,3,4,4,5,5 Hexachlorobiphenyl)												
39635-31-9	PCB 189 (2,3,3,4,4,5,5 Heptachlorobiphenyl)												
32598-13-3	PCB 77 (3,3,4,4-Tetrachlorobiphenyl)												
70362-50-4	PCB 81 (3,4,4,5 Tetrachlorobiphenyl)												
32598-14-4	PCB105 (2,3,3,4,4 Pentachlorobiphenyl)												
40321-76-4	Pentachlorodibenzo-p-dioxin, 1,2,3,7,8-												
00-08-1	Pentachlorodibenzodioxins, All Isomers												
57117-41-6	Pentachlorodibenzofuran, 1,2,3,7,8-												
57117-31-4	Pentachlorodibenzofuran, 2,3,4,7,8-												
00-09-0	Pentachlorodibenzofurans, All Isomers												
87-86-5	Pentachlorophenol												
109-66-0	Pentane, n-												
ALIPHATI	Petroleum Hydrocarbons, Aliphatic Low (C5 - C8)												
ALIPHATI	Petroleum Hydrocarbons, Aliphatic Medium (C9 - C18)												
AROMATI	Petroleum Hydrocarbons, Aromatic Low (C6 - C8; EC6-EC8)												
AROMATI	Petroleum Hydrocarbons, Aromatic Medium (C9 - C16; EC9-EC21)												
85-01-8	Phenanthrene												
108-95-2	Phenol												
75-44-5	Phosgene												
7803-51-2	Phosphine												
7664-38-2	Phosphoric acid												
85-44-9	Phthalic anhydride												
59536-65-1	Polybrominated Biphenyls												
1336-36-3	Polychlorinated biphenyls (Aroclors unspeciated)												
00-08-0	Polychlorinated Dibenzo-P-Dioxins And Furans, Total												
00-05-0	Polychlorinated Dibenzodioxins, Total												
00-05-1	Polychlorinated Dibenzofurans, Total

Notes:

1. Parent-duplicate pairs were averaged for the UCL calculation.
2. All data are included in the UCL calculation; however, some data were determined to be outliers at the 5% significance level by ProUCL 5.1's outlier tests.

Chemical Storage Room Sampling Results

Sampling conducted April 8-9, 2021

Sampling analyzed April 12, 2021

Sample	TDCE (ug/m3)
Center 5'	2230
Center 10'	3350
Center 15'	3710
Center 20'	3720
SS-24	1360
SS-25	3110

Vent Flowrates	ACFM	TDCE Conc	TDCE Emission Rate (lb/hr)	TDCE Emission Rate (tpy)	Notes
Vent 1	25,000	3.33	3.114E-04	1.36E-03	Assume Vent 1 comprises 5% of SS-30
Vent 2	25,000	3.33	3.114E-04	1.36E-03	Assume Vent 2 comprises 5% of SS-30
Vent 3	25,000	173	1.624E-02	0.07	Assume Vent 3 concentration comprises 100% of SS-35 and 90% of SS-30
Vent 9	15,000	66.9	3.761E-03	1.65E-02	Assume 30% of SS-37 emisisons are exhausted through Vent 9
Vent 10	15,000	89.2	5.014E-03	2.20E-02	Assume 40% of SS-37 emisisons are exhausted through Vent 10
Vent 12	15,000	4,603	2.587E-01	1.13	Assume room concentration is the maximum of April 2021 stack test results plus 100% of SS-38 emissions are exhausted through Vent 12
Vent 13	15,000	33.5	1.880E-03	8.24E-03	Assume 15% of SS-37 emisisons are exhausted through Vent 13
Vent 14	15,000	33.5	1.880E-03	8.24E-03	Assume 15% of SS-37 emisisons are exhausted through Vent 14
Vent 20	50	1020	1.910E-04	8.37E-04	Assume 100% of SS-36 emissions are exhausted through Vent 20
STRU73			17.35	76	Assumed to become a permit limit
Total			**17.64**	**77.26**	
Notes:					

Sample calculation: 4603.1 µg/m3 * 0.02832 m3/ft3 * 15000 ft3/min*60 min/hr * g/1000000 ug * 1 lb/453.6 g = 0.26 lb/h

Conversions

1 ft3 =	0.02832	m3
1 hr =	60	min
1 g =	1000000	ug
1 lb =	453.6	g
ton/yr =	4.38	lb/hr

Water Gremlin

STRU73

Calculations (Primary Calculation Set)

Assumptions:

Coating Rate Safety Factor 1.25

Potential Emissions Emission Factor Safety Factor 1.25

Coating g/ 5 sec	Coating g/min	Coating lb/hr/Nozzle	Maximum # Nozzles	Coating lb/hr	Potential PM, PM_{10} and $PM_{2.5}$ (lb/hr)	Potential PM, PM_{10} and $PM_{2.5}$ (tpy)	Potential VOCs (lb/hr)	Potential VOCs (tpy)	Control Efficiency	Pot. Controlled PM, PM_{10} and $PM_{2.5}$ (lb/hr)	Potential PM, PM_{10} and $PM_{2.5}$ (tpy)	
	6.2	0.41	108	44.5	0.1336	0.59	0.245	1.073	0.00%	0.13365	0.59	Replacement UV Coaters

2021 Stack Test Coating Rate **0.66** lb UV coating/hr for 2 nozzle Coater 6 Compliance Test

2021 Stack Test Emission Rate **0.0044** lb VOC/lb coating Coater 6 Compliance Test

0.0024 lb PM10/lb coating Coater 6 Compliance Test

Notes:

It is assumed that PM_{10} and $PM_{2.5}$ equals PM.

No HAPs or Greenhouse Gases will be emitted by Coaters

The average coating rate was used based on tests conducted by Water Gremlin. It is understood the PM emission rate may become an emission limit.

HEPA filter would have control of 99.98%. Control efficiencies are incorporated on the Coating tab at 99.0%.

Coater 6 *Comprehensive Emissions Test Report* , revised August 12, 2021, Pace Analytical.

Notes: Nordson 781S nozzle.
It is assumed that PM_{10} and $PM_{2.5}$ equals PM.
No HAPs or Greenhouse Gases will be emitted by Coaters
The average coating rate was used based on tests conducted by Water Gremlin. It is understood the PM emission rate may become an emission limit.

Commented [A71]: This has been corrected to 1 nozzle on 8/19/2022, to address a modeling comment and correct the associated emission rates. Modeling files are correct; emission calculations were in error.

Evaluation of Proposed Coater Addition

Prototype Coater Potential Emission Calculations on UV Coating

EQUI240, STRU72	Based on Analytical Results from June 2021

Assumptions:	
Coating Rate Safety Factor	2
Emission Rate Safety Factor	2

			Source
2021 Stack Test Coating Rate	**0.66**	lb UV coating/hr for 2 nozzles	Coater 6 Compliance Test
2021 Stack Test VOC Emission Rate	**0.0044**	lb VOC/lb coating	Coater 6 Compliance Test

Material	VOC Solvent [8]
Total tons VOCs Per Year	513.54
VOC Solvent Density (lb/gal)	10.89
VOC Content (lb/gal)	9.85
VOC (% by wt)	90%
HAP (% by wt) (Both VOC and Water Based)	0%
VOC (% by wt) - Water Based	0.005%
Hours Uncontrolled	8760
Hours Limited	8760

VOC Content of Water-based Coating Calculated

Tacolyn	0.27	Coating Mix is 27% Tacolyn, Balance is water and Foamex
Tacolyn VOC content	0.0000	by wt of Tacolyn
Foamex 1488	0.006	Coating Mix is 0.6% Foamex
Foamex VOC content	0.00%	by wt of Foamex
VOC content	0.00005	by wt
VOC content	0.005%	% by wt

VOC Emission Factor (UV Coating)
Mass Percentage 0.0000%

Notes:
1. WB - water-based. Those coaters identified by "WB Only" will only use water-based coating. Other Coaters assusme that Water Gremlin can use both WB and VOC Based coating in each coater. Spray coaters include particulate matter calculations based on the estimated solids content of the water-based coaters.
2. Maximum usage rate calculated based on VOC solvent usage data from Water Gremlin. Usage from coaters that were operated less than one hour per day were excluded because how the hour of operations were deemed to be inaccurate.
3. Coating VOC emissions will be limited by the forthcoming air permit and coaters with unlimited potential emissions greater than the limit will not be allowed to operate at their full capacity.
4. Assume that PM = PM10 = PM2.5 emissions.
5. Transfer Efficiency for water based coating based on EPA Automotive Refinishing Isocyanate Profile Chapter 6, May 1997.
6. The Bulk Tank and Soaker dispense solvent for use in the coating room. The Bulk tank and Coater emissions serve all of the coaters, therefore potential emissions are calculated separately based on maximum daily usage divided by 24 hours.
7. Water Gremlin evaluated the HAP and Air toxics contents of Tacolyn. Based on the resulting testing, no HAPs or Air Toxics were detected. Therefore, they are not addressed further.
8. UV coating emissions are based on the Coater 6 performance test from June 2021.
9. Water Gremlin has used FluoSolv WS and NEXT HD Pro as VOC Solvents. The VOC contents of the two solvents are the same. The maximum density of the two solvents (that for NEXT HD Pro) was entered for VOC solvent density. Emissions calculations are not dependent on this density.

Water Gremlin Company
Diesel Generator: Potential Emission Calculations

	EQUI 120	**STRU4**	Manufactured	11/8/2010
Emission Unit Identification Number:	**Emergency Generator Engine**		Installed	May-12

Mailbag Pots for the project:
Large #2 This is the dedicated runout pot for the CF operation. The CF scrap is melted and pumped over to the big pot #1. We should call it the CF scrap pot.
Small #3 This is our 8,000 LB pot which we use to runoff plant scrap. About 6,000 LBS/Day. We usually refer to it as the scrap pot
Die Run #4 This is a dedicated 1,800 LB pot for dead soft lead for Sweeys. We run about 14,000 LBS/Month
Collins #5 This is the 40,000 LB CF pot. We run about 20,000 LBS/Day. Collins is a poor description so let's call it the CF Pot.

Lead Control from September 2021 Die Cast 52 Test

	Inlet	Outlet
Filterable lead collected (mg)		1.9440
Filterable lead mass rate (lb/hr)		5.36E-07
Lead control efficiency		**86%**

	Inlet	Outlet

1. Tin pot particulate emission factor is obtained from the November 2018 lead melt pot testing based on uncontrolled inlet result

2. Throughputs are from tin pot information received 8/6/2021

Side Notes:
Stack Test Summary
PM Calculations

Outlet (lb/hr)	0.04	0.014	0.025	**0.026**
Melt Throughput (tons)	1.25	1.15	0.45	**0.95**
Emission Factor (lb/ton)	2.98E-02	1.22E-02	5.56E-02	**2.77E-02**
Emission Factor (lb/lb)	1.49E-05	6.09E-06	2.78E-05	**1.39E-05**
Inlet(lb/hr)	0.88	0.29	0.75	**0.64**
Melt Throughput (tons)	1.25	1.15	0.45	**0.95**
Emission Factor (lb/ton)	7.04E-01	2.52E-01	1.67E+00	**6.74E-01**
Emission Factor (lb/lb)	3.52E-04	1.26E-04	8.33E-04	**2.71E-04**

Throughput - Stack Test November 20, 2018, Page E-3. Based on the amount melted. Does not consider the amount idle, as that should be fairly consistent.
Emissions - Revised Stack Test Results submitted 06/27/2019 Tables 1&2.

PM10 Calculations

TREA26 TREA62

Notes

0. Consistent with prior submitals, we assume 5% of uncontrolled diecast emissions escape uncaptured to roof vents. Based on AP-42 Footnote a. to Table 12.11-4; 10/86.
1. Uncontrolled emissions account for testing done at inlet that "misses" the uncaptured emissions
2. For diecasting, it is assumed that PM = PM10 = PM2.5. For the billet saw, PM10 = PM2.5 = 0.51* PM.
3. Billet saw emissions based on PM10 Emission Factor from EP-450/4-022 PM10 Emisison Factor Listing Developed by Technology Transfer 1995 (lb/ton). Total Particulate emission factor calculated based on Table B.2.2 AP42 PM10 assumed to be 51% PM. Lead assumed to be 100% of PM based on component of material.
4. 2021 stack test represents the conditions at the inlet of the Nederman (uncontrolled conditions). Total uncontrolled diecast emissions are calculated from the inlet conditions divided by assumed capture efficiency (95%).
5. The maximum lead throughput short term capacity represents the maximum hourly production level for diecast lb/hr emission rates; these throughputs are used in PM and lead NAAQS modeling.
6. The hourly lead throughput annual average value represents approximate annual average throughput rates; the emissions from these throughput rates are summed and modeled at the worst-case smog hog and exhaust vent to support a facility-wide annual throughput limit for the facility.
7. The particulate matter emission factor used is the highest average emission factor from the June or September 2021 stack tests. The June 2021 average emission factor was 0.3702 lb PM $_{10}$/ton, see *Comprehensive Emissions Test Report* , revised September 2, 2021, Table 2.
8. Nederman control efficiency used is the lowest control efficiency from any run in the June or September 2021 stack tests. The September 2021 Run 2 stack test control efficiency was 86.6%.
9. The machine maximum capacity is the die cast machine unrestricted, uncontrolled maximum throughput. It is not theoretical and not actually achievable.

Coiner 10	Vanishing Oil	300	Sprayed	138	0.0080	0.035
				Total	**0.033**	**0.147**

1. Water Gremlin confirmed that all machines use Vanishing Oil (only) as lubricant. Prior use of Kerosene (when coining machines were at North Campus) has been discontinued.
2. Bath (Trough) machines assumed to produce zero PM emissions.
3. PM Emissions are assumed to be 100% in PM2.5 size category. That is, PM = PM10 = PM2.5.
4. Margin of Safety of 100% has been added for conservatism (e.g., to account for differences between machines and to account for condensable PM). Condensable emissions were not able to be measured with Particle Counter, but are believed to be low or zero due to non-heated nature of coining process and no combustion occuring.

PM Emission Rate used for Modeling: **0.033** lb/hr
(as PM2.5 or PM10)

Water Gremlin
Coining Operation Emissions - Particulate Matter
Based on Water Gremlin Particle Counter & Velocity Measurements - 7/30/2021
8/19/2021

Safety Factor (for Conservatism)[7]: 2

Unit	Stack Exit Velocity (ft/min)[1]	Stack Diameter (ft)	Stack Flow Rate (acfm)	(scfm)[2]	(standard m^3/hr)	Stack Temp (deg F)[3]	PM Counter Measurement During Operation (mg/m^3)[4]	PM Counter - Idle (Room Air or Background) (mg/m^3)[4]	PM Counter: Operation minus Background (mg/m^3)	PM Emission Rate (lb/hr)[5]	Production Rate[6] (lb/hr product)	Emission Factor (lb PM/lb product)	Emission Factor with Added Margin of Safety (lb PM/lb product)
Coiner 1	1450	0.5	285	274	466	90	1.80	0.252	1.548	0.0016	55	2.89E-05	5.77E-05

											Maximum	2.89E-05	5.77E-05
											Average	2.11E-05	4.22E-05

1. Measured by Tim Harding, Water Gremlin, using TSI Velocicalc model 8350. Duct diameter given as 6" between each machine and combined duct from all machines to stack.
2. Standard temperature and pressure assumed to be 70 degrees F and 1 atmosphere. Atmospheric pressure effects excluded in calculation.
3. Per Tim Harding email, 7 degrees rise in coining room from ambient outside. Assume 90 degrees for the day of testing.
4. Measured by Tim Harding using TSI Dustrak II model 8532.
5. Calculated by converting PM counter results to mass emission rate based on scfm flow rate.
6. Production Rates per machine provided by Tim Harding.
7. Safety factor of 2 has been added for conservatism (e.g., to account for differences between machines and to account for condensable PM). Condensable emissions were not able to be measured with Particle Counter, but are believed to be low or zero due to non-heated nature of coining process and no combustion occuring.

Emission Factor used for PTE Calculations: 5.77E-05 (lb PM/lb product)

Conversions
dscfm = acfm * (460 R + 70)/(460 R + 90)
m3 = cf * (1/3.2808)^3*60
lb = mg * 0.0000022

Natural Gas External Combustion Units: Potential Emission Calculations

Each individual natural gas combustion unit qualifies as an Insignificant Activity pursuant to Minn. R. 7007.1300, subp. 3(F).

Water Gremlin Company
Cooling Tower: Potential Emission Calculations **FUGI 1, 2, 4**

Unit Information	
Description:	Cooling Tower
Material	Water
Drift Rate	0.02%
Cycles	1050 gal/min max
Make-up Water TDS	7700 lb solids/10^6 lb water
Hours Uncontrolled	8760
Hours Limited	8760

AP 42 13.4 default

Make-up Water TDS from correspondence 3-13-15.

PM emission factor is based on AP-42 Section 13.4 "Wet Cooling Towers" (Rev 01/95) described procedures for estimating cooling tower water TDS

Emission Rate (lb/hr) = Water Circulation Rate*Drift Rate*TDS
where
TDS = Make-up water TDS in lb solids per 10^6 lb wate

Particulate Matter

Pollutant	Emission Rate (lb/hr)	Uncontrolled Emissions (tpy)	Control Efficiency	Controlled Emissions (tpy)	Limited Emissions (tpy)
TSP	8.09E-01	3.54E+00	0%	3.54E+00	3.54E+00
PM	7.47E-01	3.27E+00	0%	3.27E+00	3.27E+00
PM_{10}	1.55E-01	6.79E-01	0%	6.79E-01	6.79E-01
$PM_{2.5}$	1.13E-03	4.97E-03	0%	4.97E-03	4.97E-03

No Pollutants other than particulate in Cooling Tower emissions. Assume PM10 and PM2.5 emissions speciated according to the New Mexico method belo

VOC Content	100.00%
T-DCE	100.00%
Total HAPs	0.00%

Note: Exhaust concentration of TCE is from client on 10/9/2018.
Calculation based on TCE test results assuming a 100% safety factor to determine T-DCE emissions.

Emission rate is calculated from EPA Method 2

Emission Rate (lb/hr) = C_{gas} x MW x flow rate x Constant
where
C_{gas} = Concentration of gas Constant = 1.57E-07
MW = Molecular weight

Pollutant	Uncontrolled Emission Rate (lbs/hr)	Maximum Uncontrolled Emissions (tons/yr)	Pollution Control Efficiency (%)	Controlled Emissions (lb/hr)	Maximum Controlled Emissions (tons/yr)
T-DCE	2.33E-01	1.02E+00	0.0%	2.33E-01	1.02E+00

Water Gremlin

Paved Haul Roads

Paved Haul Road Equation 1 (AP-42 Section 13.2.1 - 01/11)

$$E = k * (sL)^{0.91} * (W)^{1.02}$$

where:

E = Emission factor (lb/VMT, vehicle miles traveled)

k = Particle size multiplier (lb/VMT) from AP-42, Table 13.2.1-1, k=0.011 PM, k= 0.0022 PM_{10}, k= 0.00054 $PM_{2.5}$.

sL = Road surface material silt loading content (g/m2) *Assumption* **1.1** g/m2 AP-42, Table 13.2.1-3 for Corn Wet Mills [1]

W = Mean vehicle weight based on the "fleet" average weight of all vehicles traveling the road.

Notes:

1. The Corn Wet Mills value is the only type of industry listed that does not typically have outdoor fugitive material handling and outdoor storage piles. Therefore, the Corn Wet Mill value is the most representive data for Water Gremlin of the EPA industrial source values.

Water Gremlin Company

Process Equipment Rule Emission Limit Calculations

Table K: Instructions for determining your particulate limit

Minnesota has a State rule for the concentration of particulate matter that may be in your exhaust stream. The unit of the standard is grains per dry standard cubic foot. You need to convert your actual exhaust flow to dry standard cubic feet per minute to find the emission limit from the rule.

Sources subject to this rule are required to meet the emission limits established at all times. These limits will vary depending on operating conditions. To determine compliance at any point in time (i.e. for a stack test), follow the steps below:

1) Determine the amount of dry material (subtract any water or moisture content) in pounds per hour that is processed by your equipment.

2) Use Table K.1 to determine your allowed emission rate based on process weight rate. If your process weight rate falls between two values on the table, interpolate or extrapolate using the equation:

$E = 3.59 \times \left(\frac{P}{2000}\right)^{0.62}$ P < 60,000 lbs/hour; and:

$E = 17.31 \times \left(\frac{P}{2000}\right)^{0.16}$ P > 60,000 lbs/hour

where: E = emission rate in lbs/hour; and
P = process weight rate in lbs/hour

3) If your process equipment is vented to the atmosphere, determine the airflow through your stack. Correct to 68 F and 14.7 psi, and correct to remove any moisture in the gas stream to obtain the air flow in dry standard cubic feet per minute (dscfm).

4) Use Table K.2 to determine your allowed concentration in grains per dry standard cubic foot (gr/dscf). Interpolate using the equation:

$c = 1.7627 \times V^{-0.3241}$ where: c = concentration in gr/dscf,
V = gas volume in dscfm

5) Determine which of the two emission rates calculated above is *less stringent* . To convert a concentration (calculated in step 4) to an emission rate (calculated in step 2), use the following equation:

$E = c \times V \times \frac{60}{7000}$

where: E = emission rate in lbs/hour;
c = concentration in gr/dscf;
V = gas volume in dscfm

Table K.1

Process Rate (lbs/hour)	Emission Rate (lbs/hour)
100	0.55
500	1.53
1000	2.25
5000	6.34
10000	9.73
20000	14.99
60000	29.6
80000	31.19
120000	33.28
160000	34.85
200000	36.11
400000	40.35
1000000	46.72

Table K.1

Source Gas Volume (dscfm)	Concentration (gr/dscf)
7,000 or less	0.1
8,000	0.096
9,000	0.092
10,000	0.089
20,000	0.071
30,000	0.062

Introduction

This memorandum describes the methodology employed for modeling annual lead RASS im Gremlin.

Overview

Stantec Consulting Services Inc. (Stantec) develoDed a modeling strategy to demonstrate cc the Risk Assessment Screening Spreadsheet (RASS), specifically for exposure to lead emis! gardener, that demonstrates protection of human health and the environment and allows Wa operate their die cast (DC) processes as needed. A facility-wide annual throughput limit of 71 of lead for the entirety of the DC process, without any limit for a specific DC machine, meets benchmark for inhalation and non-inhalation exposure. Each DC machine does have a daily other modeling analyses. Stantec conducted modeling exercises that show compliance with benchmark at this annual throughput level regardless of which DC machine is used and whic fan emits the uncontrolled DC emissions. The explanation of the modeling method is present

The modeling evaluation for lead was unique for several reasons. The facility needs operatio operate the specific DC machines corresponding to customer orders and cannot necessarily machines will be heavily utilized over the life of the forthcoming air permit. The sum of the da limits for each DC equates to over 160,000,000 160 million) Dounds of lead throughput per \ much higher than the facility has used in the past 12 years. However, assigning annual lead to each DC would unnecessarily constrain operations beyond what is practicable. Therefore, utilization rate of the total facility DC capacity is appropriate to meet both public health conce needs. The modeling shows that the facility—wide limit would be protective. Modeling looked scenario where all captured lead emissions from DC operations exit the facility at one smog uncaptured lead emissions from DC operations exit the facility at one fan, creating the highe! impact at a receptor. The method used to make this determination is described below.

Emission Calculations

The emission calculations workbook and AQDM-02 detail the diecasting throughputs as well matter (PM) and lead emissions from the DC machines. Emission factors were derived from

on DC machines where lead emissions were tested at the inlet to the SH and the outlet. Whig install Nederman control devices in series ahead of the SH for each DC, the SH-only stack t‹ factors are used for conservatism. The pollution control train is assumed to capture 95% oT E

while 5% of DC emissions exit the facility uncontrolled. Total annual lead emissions from the are calculated as follows:

Smog Hog Lead Emissions = Lead Throughput * lead emission factor from the outlet

48.25 lb lead emissions/year = 78,711,000 lb lead throughput/year * 6.13e-7 lb lead emission throughput. This equates to an average of 5.5e-3 lb lead/hour.

Exhaust Fan Lead Emissions = (Lead Throughput "lead emission factor from the inlet)/(95% efficiency) " (1-0.95)

8.45 lb lead emissions/year = 78,711,000 lb lead throughput/year * 2.04e-6 Ib lead emissions throughput / 0.95 * 0.05. This equates to an average of 9.6e-4 Ib lead/hour.

Model Setup

The modeling method evaluated all combinations of DC captured lead emissions and all unc emissions, along with lead emissions from the rest of the plant. With this method, Stantec ev smog hog (SH) individually with all 5.5e-3 lb/hr of captured lead emissions exiting out its res((STRU) and all 9.6E-4 lb/hr of uncaptured DC lead emissions rotating between each fan, whi plant lead emissions remain unchanged. The analysis for the SH emissions and rotating fan accomplished with source groups in AERMOD. For example, all captured SH emissions (5.5› emitted from STRU15 (SH#1), all uncontrolled DC lead emissions (9.6e-4 lb/hr) are applied t (STRU43 through STRU53 and STRU56), while concurrently assuming and the rest of the pt normal, resulting in 12 different source groups. The setup for these 12 source groups for STF presented in Table 1, and the uncontrolled DC fan emissions are highlighted in each group I(that each source group is independent, and annual impacts from each source group over eai years represents impacts as if the plant operated in this manner for the entire year.

The organization of this modeling method was established by SH STRU number, with the sa
group methodology set for all 15 SH STRUs for each of the five meteorological years. This r‹
different sets of AER MOD input/output files. Over the entire analysis, this method provides a
concentrations for each SH STRU/uncaptured dc fan/model year, resulting in 900 individual ‹
concentrations. The resultant matrix is included with the modeling files that summarizes all c‹
obtained with this method. Each of these 15 SH STRU run sets contain the captured DC emi
lb/hr) for every SH, _II uncontrolled DC emissions (9.6E-4 lb/hr) for the fans, and the remains
lead emissions. The output controlled by source grouping ignores the 14 SH STRUs not con!
model run. This results in a warning message in the AERMOD output that 14 STRUs were rr
included in any source groups, which is the desired effect.

Bodel Receptor 6rid

The receptor grid employed for this analysis (see Figure 1) was separate and distinct from th for the evaluating m odeled compliance with the *NAAOS.* The NAAQS grid is the ambient air property boundary, and represents where a receptor could have access near the facility. Bas MPCA on May 5, 2022, the receptor grid for this annual lead risk assessment follows the Wa property line (not fence line / controlled access), the western edge of Otter Lake Road and th of Whitaker Street. This analysis is for evaluation of the urban gardener and resident exposu receptors indicate the edge of where a garden would be possible based on current or future j use.

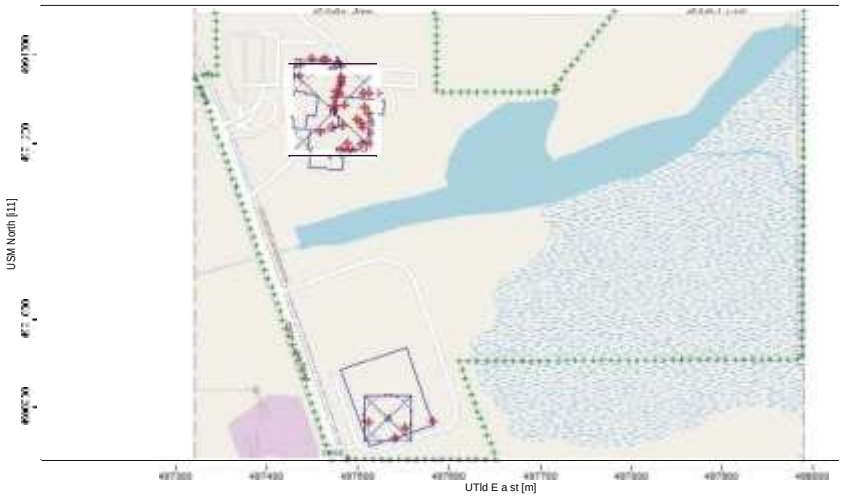

Figure 1 Receptor Grid for Annual Lead RASS

Reference: Method for the Annual Lead RASS Modeling Analysis

Model Results

The maximum concentration for each SH STRU/uncaptured dc across all five years was calc
matrix of 180 values. The maximum of this value represents the worst-case SH STRU/uncap
combination. This combination is STRU23 with fan STRU52 at a concentration of 0.02938 p
modeling method shows that an annual facility limit of 78,711,000 pounds of lead throughput
the DC operations, results in a maximum concentration which meets the noncarcinogenic he
for an urban gardener as represented in MPCA's RASS. The method with the multiple combi
lead emissions assigned to individual smog hogs and roof exhaust fans also shows that indi
machines limitations are unnecessary.

RASS spreadsheet

Air quality modeling Air Emissions Risk Analysis (AERA)

Risk Assessment Screening Spreadsheet (**RASS**)

Doc Type: Air Emissions Risk Assessment - External Documentation

RASS version: 2020-12

The Risk Analysis Screening Spreadsheet (RASS) has several linked **input** and **output** worksheets that produce screening risk values. The worksheet tabs are color-coded as follows:

Input pages
Outputs
Data and reference tables

The following worksheets are included in this workbook:

README: General overview and instructions on spreadsheet use.

Remediation Emission Calculator: Input site information, system parameters, chemicals, CAS numbers, and analytical results in the yellow-shaded cells. For site-specific modeling, you must additionally enter the AERMOD calculated dispersion factors in the StkDisp tab. Once the site emissions have been estimated in this worksheet, enter the chemical specific emission rates for pounds per hour or tons per year in the Emissions (start here) worksheet. If more that ten chemicals are of itnerest at the site, copy the additional rows needed.

Emissions (input): The user enters facility information in the yellow area at the top of the spreadsheet. The user also inputs emission rates for each chemical listed that is potentially emitted from the facility. User enters short-term chemical emission rates in pounds per hour and long-term chemical emission rates in tons per year for each chemical found on the spreadsheet that is emitted or is potentially emitted at the facility. These rates must be individually calculated and entered; the spreadsheet does not calculate one from the other**.** Brief guidance on merging stacks can be found below.

Dispersion (input): The user inputs stack height and receptor distance in the top portion of the screen to use the dispersion factor look-up tables (Disp Tables worksheet). Brief guidance on merging stacks can be found below. Results from the automated lookup process can be over-written by manually entering dispersion factors from more refined dispersion modeling into the lower half of the worksheet.

Summary (output): Summarizes results from spreadsheet analysis. Individual chemical screening hazard quotients and cancer risks are summed to obtain a total screening hazard index for acute, subchronic and chronic noncancer inhalation effects and a total screening incremental inhalation cancer index. Total hazard and cancer indices for indirect (non-inhalation) pathways are also shown. Land use plans and actual receptors in the vicinity of the facility determine whether both farmer and resident risks are considered. If land use information is not available, facility risks are assumed to be those for the farmer scenario.

Risk Calcs (output): Air concentrations are compared to noncancer acute and chronic inhalation health benchmarks (IHBs) in the Tox Values worksheet to estimate screening inhalation hazard quotients and screening incremental inhalation cancer quotients. The resulting inhalation chronic hazard quotients and incremental cancer risks are multiplied by multimedia factors for a farmer and a resident to obtain screening level risks from indirect (non-inhalation) pathways. The total risks for inhalation and indirect pathways are then computed for individual chemicals and for all pathways. This page has been designed to automatically highlight those cells in which the chemical has a noncancer hazard quotient above 0.1 or a cancer risk above 10e-06.

Concs (output): Hourly, 3-hour, 24-hour, monthly and annual air concentrations representing maximum crieria pollutant and air toxics concentrations at or beyond the receptor distance selected in the StkDisp worksheet are calculated by multiplying dispersion factors (µg/m3 per g/s) and emission rates.

Note: The "Acute" trichloroethylene (TCE) health impacts are estimated from the 24 hour dispersion information. The toxicity value is derived for short term (24 hour) and not for hourly exposures.

Tox Values: (reference) A list of inhalation health benchmark values used in the acute, subchronic noncancer, chronic nonchancer and cancer inhalation risk calculations.

MPS Factors (reference): Multipliers applied to inhalation risks to compute screening level ingestion hazard quotients and cancer risks for persistent bioaccumulative toxic chemicals. These multipliers were derived using the Industrial Risk Assessment Program software, which incorporates algorithms found in USEPA's July 1998 Human Health Risk Assessment Protocol for Hazardous Waste Combustion Facilities.

Early Life Adjust (reference): This table identifies the carcinogens that should be adjusted to account for potential early life exposures.

Disp Tables (reference): Conservative dispersion factors dependent on the stack height and receptor distance input in the Dispersion worksheet. These hourly, 24-hour, monthly and annual factors are used to estimate the maximum air concentrations at or beyond the receptor distance selected. Dispersion factor units are µg/m^3 per g/s.

Combining Stacks with Similar Dispersion Characteristics

To accommodate multiple stacks more efficiently, it may be helpful to group stacks with similar dispersion characteristics such as stack height, stack diameter, exit velocity, exit temperature, and proximity to similarly sized buildings. "Similar" means stacks are located within approximately 100 meters of each other near similar sized buildings and stack parameters vary less than 20 percent.*

Combining Stacks for Use with Look-Up Table

Create different groups of stacks by combining those with similar heights in each group. Within each group, select the shortest stack height in the group. The look-up table reflects generally worst-case conditions for other parameters (i.e., stack diameter, stack exit velocity, stack exit temperature, and stack-to-building geometry).

* See EPA document titled "Screening Procedures for Estimating the Air Quality Impact of Stationary Sources, Revised". Pages 2-2 and 2-3 offer a more complex method for combining similar stacks. However, it must be repeated for each pollutant – this can be tedious if there are many pollutants (i.e., it uses individual stack emission rates and stack parameters). It may be useful for refined follow-up reviews (e.g., risk driver pollutants), but not the initial screening.

Footnotes & Glossary

1. An inhalation unit risk of 400 (ug/m3)-1 was calculated using the MDH and USEPA-recommended oral slope factor of 1.4E+06 (mg TCDD TEQ/kg/d-1)assuming an inhalation rate of 20.0 m3/day by a 70 kg adult and assuming 100% absorption.
2. Dioxin and furan congener concentrations were calculated using the World Health Organization's 2005 Toxic Eqivalency Factor (TEF) scheme to weight each compound according to its toxicity relative to 2,3,7,8-TC
3. "Petroleum Hydrocarbon, Aliphatic" value was derived based on Inhalation Studies on Dearomatized Petroleum Streams in: Development of Fraction Specific Reference Doses and Reference Concentrations from Total Petroleum Hydrocarbons, Volume 4, Total Petroleum Hydrocarbon Working Group Series. The value can be applied to aliphatic petroleum mixtures containing primarily C9 - C16 and minimal aro
4. This chronic value may not provide protection for previously-sensitized individua
5. Acute MDH HRV is for irritancy, but there is little difference between the level where mild irritancy occurs and levels where more severe adverse health effects occ
6. The chronic HRV for diesel particulates was not developed as protective for potential cancer effect
7. Inhalation unit risk assumes POM mixture is 5% as toxic as benzo(a)pyrene - Based on guidance provided in EPA's "Air Toxics Risk Assessment Reference Library Volume 2 - Facility-Specific Assessment" http://www.epa.gov/ttn/fera/risk_atra_main.ht
9. This Cal OEHHA memo (http://www.oehha.ca.gov/air/chronic_rels/pdf/mJED2WH.pdf) was adopted on February 23, 2000 and includes the chronic inhalation REL (ug/m3) for Chlorinated dioxins (1746-01-6) and dibenzo furans (5120-73-19). http://www.oehha.ca.gov/air/hot_spots is more gene
10. Considered or adjusted for early life exposure.
11. 2011 CalEPA adopted WHO Equivalents and calculated individual PCB congeners from the
12. The averaging period used for this health benchmark is 24-hrs

MPCA # - An ID number assigned by MPCA
HRV - Minnesota Department of Health Health Risk Valu
HBV - Minnesota Health Department Health Based Valu
IRIS - EPA Integrated Risk Information System
CAL EPA - California Office of Environmetal Health Hazard Assessmen
HEAST - EPA Health Effects Assessment Summary Table
MPCA - Minnesota Pollution Control Agency derived valu

Consolidated list of health endpoints as shown on the summary tab

End point	End points include
Eyes	Related to eyes/sight
Resp	Respiratory system, Olfactory, Lungs, Nasal system, Nasal septum atrophy, nasal epithelial change
Cardio	Cardiovascula
Kidney	Rena
Repro	Developmental/reproductive/endocrine/fetotoxicit
Blood	Hemetological, blood, immune system, lymph syste
Skin	
Neuro	Neurological/CN
Digest	Allmentary/digestive

Bone/Teeth
Ethanol specific
Systemic
Liver
Auditory

CAS# or MPCA#	Chemical Name	Early life adjustment needed	Toxicity value source	Notes
60-35-5	Acetamide	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
53-96-3	Acetylaminofluorene, 2-	Yes	CAL EPA	Value developed earlier than CalEPA early life guidance
3688-53-7	Acrylamide, 2-(2-furyl)-3-	Yes	CAL EPA	Value developed earlier than CalEPA early life guidance
107-13-1	Acrylonitrile	Yes	HRV	Updated prior to 2008
309-00-2	Aldrin	Yes	IRIS	Updated prior to 2005
107-05-1	Allyl chloride	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
712-68-5	Amino-5-(5-nitro-2-furyl)-	Yes	CAL EPA	Value developed earlier than CalEPA early life guidance
6109-97-3	Amino-9-ethylcarbazoleh	Yes	CAL EPA	Value developed earlier than CalEPA early life guidance
117-79-3	Aminoanthraquinone, 2-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
62-53-3	Aniline	Yes	CAL EPA	Toxicity values not based on a lifetime exposure.
140-57-8	Aramite	Yes	IRIS	Updated prior to 2005
1332-21-4	Asbestos (units in fibers)	Yes	IRIS	Unit risk based on occupation exposures, not early life
1332-21-4-LAA	Asbestos, Libby Amphibo	Yes	IRIS	Unit risk based on occupation exposures, not early life
10294-40-3	Barium Chromate	Yes	CAL EPA	Unit risk based on occupation exposures, not early life
71-43-2	Benzene	No	HRV	ADAFs were not applied to the inhalation HRV in the RASS
92-87-5	Benzidine	Yes	HRV	Updated prior to 2008
100-44-7	Benzyl chloride	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
7440-41-7	Beryllium	Yes	HRV	Exposure study was occupational, adults. (IRIS documentation)
BERYLLIUM-CO	Beryllium Compounds	Yes	HRV	Exposure study was occupational, adults. (IRIS documentation)
111-44-4	Bis(2-chloroethyl)ether	Yes	IRIS	Updated prior to 2005
117-81-7	Bis(2-ethylhexyl)phthalat	Yes	CAL EPA	Toxicity values not based on a lifetime exposure.
542-88-1	Bis(chloromethyl)ether	Yes	MDH HRV	Updated prior to 2008
75-27-4	Bromodichloromethane	Yes	CAL EPA	Value developed earlier than CalEPA early life guidance
75-25-2	Bromoform	Yes	IRIS	Updated prior to 2005
25013-16-5	Butylated hydroxyanisole	Yes	CAL EPA	Value developed earlier than CalEPA early life guidance
3068-88-0	Butyrolactone, beta-	Yes	CAL EPA	Value developed earlier than CalEPA early life guidance
7440-43-9	Cadmium	Yes	HRV	Exposure study was occupational, adults. (IRIS documentation)
CADMIUM-COM	Cadmium Compounds	Yes	HRV	Exposure study was occupational, adults, mutagenic studies inconclusive. (IRIS documentation)
12789-03-6	Chlordane or (57-74-9)	Yes	IRIS	Updated prior to 2005
115-28-6	Chlorendic acid	Yes	CAL EPA	Value developed earlier than CalEPA early life guidance
108171-26-2	Chlorinated Paraffins (C1	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
563-47-3	Chloro-2-methylpropene,	Yes	CAL EPA	Updated prior to 2005
67-66-3	Chloroform	Yes	IRIS	Updated prior to 2005
107-30-2	Chloromethyl Methyl Ethe	Yes	CAL EPA	Updated prior to 2005
95-83-0	Chloro-o-phenylenediami	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
95-69-2	Chloro-o-toluidine, p-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
1333-82-0	Chromic acid mists and d	Yes	HRV	EPA determined mutagen
7440-47-3	Chromium	Yes	HRV	Exposure study was occupational, adults, mutagenic studies inconclusive. (IRIS documentation)
18540-29-9	Chromium (Hexavalent)	Yes	HRV	EPA determined mutagen
18540-29-9-pm	Chromium (Hexavalent) -	Yes	MDH HRV	EPA determined mutagen
CHROM-COMP	Chromium Compounds	Yes	HRV	EPA determined mutagen
87-29-6	Cinnamyl anthranilate	Yes	CAL EPA	Updated prior to 2005
10061-01-5	cis-1,3-Dichloropropene	Yes	IRIS (2000)	Updated prior to 2005
8007-45-2	Coal Tar	Yes	HRV	Updated prior to 2008
0-00-7	Coke Oven Emissions	Yes	HRV	Updated prior to 2008
120-71-8	Cresidine, p-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
135-20-6	Cupferron	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
50-29-3	DDT	Yes	IRIS	Updated prior to 2005
615-05-4	Diaminoanisole, 2,4-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
101-80-4	Diaminodiphenyl ether, 4,	Yes	CAL EPA	Update prior to 2005
103-33-3	Diazene, Diphenyl	Yes	IRIS	Updated prior to 2005
96-12-8	Dibromo-3-chloropropane	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
764-41-0	Dichloro-2-butene, 1,4-	Yes	PPRTV	Positive mutagenicity tests.
1476-11-5	Dichloro-2-butene, cis-1,4	Yes	PPRTV	Positive mutagenicity tests.
106-46-7	Dichlorobenzene(p), 1,4-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
25321-22-6	Dichlorobenzenes	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
25321-22-6	Dichlorobenzenes	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
91-94-1	Dichlorobenzidene, 3,3-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
542-75-6	Dichloropropene, 1,3-	Yes	IRIS	Updated prior to 2005
62-73-7	Dichlorvos	Yes	CAL EPA	Updated prior to 2005
60-57-1	Dieldrin	Yes	IRIS	Updated prior to 2005
60-11-7	Dimethyl aminoazobenze	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
121-14-2	Dinitrotoluene, 2,4-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
122-66-7	Diphenylhydrazine, 1,2-	Yes	IRIS	Updated prior to 2005
106-89-8	Epichlorohydrin (l-Chloro-	Yes	HRV	Updated prior to 2008
51-79-6	Ethyl carbamate (Urethan	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
106-93-4	Ethylene dibromide (Dibr	Yes	HRV	Updated prior to 2008
107-06-2	Ethylene dichloride (1,2-D	Yes	IRIS	Updated prior to 2005
75-21-8	Ethylene oxide	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
96-45-7	Ethylene thiourea	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
75-34-3	Ethylidene dichloride (1,1	Yes	CAL EPA	Toxicity values not based on a lifetime exposure.
50-00-0	Formaldehyde	Yes	MDH	EPA Toxicological review (3/17/2010)
76-44-8	Heptachlor	Yes	IRIS	Updated prior to 2005
1024-57-3	Heptachlor epoxide	Yes	IRIS	Updated prior to 2005
118-74-1	Hexachlorobenzene	Yes	IRIS	Updated prior to 2005
87-68-3	Hexachlorobutadiene	Yes	IRIS	Updated prior to 2005
608-73-1	Hexachlorocyclohexane (	Yes	IRIS	Updated prior to 2005
319-84-6	Hexachlorocyclohexane,	Yes	IRIS	Updated prior to 2005
319-85-7	Hexachlorocyclohexane,	Yes	IRIS	Updated prior to 2005
302-01-2	Hydrazine	Yes	HRV	Updated prior to 2008
10034-93-2	Hydrazine sulfate	Yes	HRV	Updated prior to 2008
7439-92-1	Lead	Yes	CAL EPA	Toxicity values not based on a lifetime exposure.
7758-97-6	Lead Chromate	Yes	HRV	EPA determined mutagen
LEAD-COMPS	Lead Compounds	Yes	CAL EPA	Toxicity values not based on a lifetime exposure.
58-89-9	Lindane (all isomers)	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
1634-04-4	Methyl tert butyl ether	Yes	CAL EPA	Toxicity values not based on a lifetime exposure.
101-14-4	Methylene bis(2-chloroan	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
101-77-9	Methylenedianiline, 4,4-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
90-94-8	Michler's ketone	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
10595-95-6	N- Nitrosomethylethylami	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.
7440-02-0	Nickel	Yes	HRV	Toxicity studies of worker exposures (not lifetime), Linear carcinogen (EPA IRIS documentation)
NICKEL-COMP	Nickel Compounds	Yes	HRV	Toxicity studies of worker exposures (not lifetime), Linear carcinogen (EPA IRIS documentation)
0-02-5	Nickel refinery dust from t	Yes	IRIS	Toxicity studies of worker exposures (not lifetime), Linear carcinogen (EPA IRIS documentation)
12035-72-2	Nickel sulfide (NI3S2)	Yes	HRV	Toxicity studies of worker exposures (not lifetime), Linear carcinogen (EPA IRIS documentation)
139-13-9	Nitrilotriacetic acid	Yes	CALEPA	Updated prior to 2005
18662-53-8	Nitrilotriacetic acid, trisod	Yes	CALEPA	Updated prior to 2005

156-10-5	Nitrosodiphenylamine, p-	Yes	CAL EPA	Toxicity value based on less than a lifetime exposure.

Commented [A74]: For TREA 55 – TREA 59 (TBD), Water Gremlin has decided to install Nederman HEPA filters on the spray coaters requiring PM control. Similar to the diecast machine Nederman HEPA filters, the manufacturer does not recommend opening the unit until indicated by one of the pressure gauges. Checks of the pressure gauges once each operating day will suffice for following manufacturer-recommended O&M procedures. The permit should be updated for COMG 14 HEPA filters accordingly.

						PM < 10 micron	100	99.9	No	Null	Mfr/ Vendor data	Null	No	Null

SI Id	Sequence	Requirement
TFAC 1	1240	Permit Appendices: This permit contains appendices as listed in the permit Table of Contents. The Permittee shall comply with all requirements contained in the following appendices: Appendix A: Insignificant Activities and General Requirements; Appendix B: Maximum Material Content, Emissions Calculations Assumptions, and Analytical Methods for VOC, Water-Based, and Ultraviolet-Cured (UV) Coating Appendix C: NAAQS and AERA Modeling Parameters; Appendix D: Emission Factors for Lead Processing Units; Appendix E: Performance Test Recordkeeping; Appendix F: VOC Ambient Air Monitoring Plan; Appendix G: General Public Preclusion Plan; Appendix H: Minimum requirements for a revised VOC and TO-15 ambient monitoring; and Appendix I: Equipment Inventory at the time of permit issuance; Appendix J: 40 CFR pt. 60, subp. IIII - Standards of Performance for Stationary Compression Ignition Internal Combustion Engines; and Appendix K: 40 CFR pt. 60, subp. A - General Provisions. [Minn. R. 7007.0800, subp. 2(A) & (B)]
TFAC 1	1245	The Permittee must comply with Minn. Stat. 116.385. The Permittee may not use trichloroethylene (TCE) at its permitted facility including in any manufacturing, processing, or cleaning processes, except as described in Minn. Stat. 116.385, subd. 2(b) and 4. The permittee used TCE before the issuance of permit No, 12300341-101 and has replaced TCE; any chemical replacing TCE must be less toxic to human health and reviewed in a form determined and approved by the Commissioner of the Pollution Control Agency. This is a state-only requirement and is not enforceable by the U.S. Environmental Protection Agency (EPA) Administrator and citizens under the Clean Air Act. [Minn. R. 7007.0100, subp. 7(X), Minn. Stat. 116.385]
TFAC 1	1246	This permit establishes limits on the facility to keep it a minor source under New Source Review, Part 70, and NESHAPs. The Permittee cannot make any change at the source that would require a change to a Title I Condition or a synthetic minor limit that ensures the facility avoid a major source status under New Source Review, Part 70, and NESHAPs until a major permit amendment has been issued. This includes changes that might otherwise qualify as insignificant modifications and minor or moderate amendments. [Minn. R. 7007.0100, subp. 25(A), Minn. R. 7007.1500, subp. 1(C), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, Title I Condition: Avoid major source under 40 CFR 63.2, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TFAC 1	1247	Equipment Labeling: The Permittee shall permanently affix a unique number to each emissions unit for tracking purposes. Each number shall correlate the unit to the appropriate Subject Item number used in this permit. The number can be affixed by placard, stencil, or other means. The number shall be maintained so that it is readable and visible at all times from a safe distance. If equipment is added, it shall be given a new unique number; numbers from replaced or removed equipment shall not be reused. [Minn. R. 7007.0800, subp. 2(A)]
TFAC 1	1248	Equipment Inventory: The facility equipment inventory at the time of permit issuance is listed in Appendix I. The Permittee shall maintain a written revision to Appendix I with a current list of all emissions units, operating monitors, and control equipment on site. The Permittee shall update the list in Appendix I to include any replaced, modified, or new equipment prior to making the change. The list shall correlate the units to the Subject Item numbers used in this permit and shall include the data on GI-04, GI-05B, GI-05C, and GI-05F. The date of construction shall be the date the change was made for replaced, modified, or new equipment. [Minn. R. 7007.0800, subp. 2(A)]

SI Id	Sequence	Requirement
TFAC 1	1260	PERMIT SHIELD: Subject to the limitations in Minn. R. 7007.1800, compliance with the conditions of this permit shall be deemed compliance with the specific provision of the applicable requirement identified in the permit as the basis of each condition. Subject to the limitations of Minn. R. 7007.1800 and 7017.0100, subp. 2, notwithstanding the conditions of this permit specifying compliance practices for applicable requirements, any person (including the Permittee) may also use other credible evidence to establish compliance or noncompliance with applicable requirements. This permit shall not alter or affect the liability of the Permittee for any violation of applicable requirements prior to or at the time of permit issuance. [Minn. R. 7007.1800(A)(2)]
TFAC 1	1380	Circumvention: Do not install or use a device or means that conceals or dilutes emissions, which would otherwise violate a federal or state air pollution control rule, without reducing the total amount of pollutant emitted. [Minn. R. 7011.0020]
TFAC 1	1390	Air Pollution Control Equipment: Operate all pollution control equipment whenever the corresponding process equipment and emission units are operated. [Minn. R. 7007.0800, subp. 16(J), Minn. R. 7007.0800, subp. 2(A) & (B)]
TFAC 1	1400	Operation and Maintenance Plan: Retain at the stationary source an operation and maintenance plan for all air pollution control equipment. At a minimum, the O & M plan shall identify all air pollution control equipment and control practices and shall include a preventative maintenance program for the equipment and practices, a description of (the minimum but not necessarily the only) corrective actions to be taken to restore the equipment and practices to proper operation to meet applicable permit conditions, a description of the employee training program for proper operation and maintenance of the control equipment and practices, and the records kept to demonstrate plan implementation. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 16(J)]
TFAC 1	1410	Operation Changes: In any shutdown, breakdown, or deviation the Permittee must immediately or as soon as possible considering plant and personnel safety take all practical steps to modify operations to reduce the emission of any regulated air pollutant. No emissions units that have an unreasonable shutdown or breakdown frequency of process or control equipment are permitted to operate. [Minn. R. 7019.1000, subp. 4]
TFAC 1	1420	Fugitive Emissions: Do not cause or permit the handling, use, transporting, or storage of any material in a manner which may allow avoidable amounts of particulate matter to become airborne. Comply with all other requirements listed in Minn. R. 7011.0150. [Minn. R. 7011.0150]
TFAC 1	1430	Noise: The Permittee shall comply with the noise standards set forth in Minn. R. 7030.0010 to 7030.0080 at all times during the operation of any emission units. This is a state only requirement and is not enforceable by the EPA Administrator or citizens under the Clean Air Act. [Minn. R. 7030.0010-7030.0080]
TFAC 1	1440	Inspections: The Permittee shall comply with the inspection procedures and requirements as found in Minn. R. 7007.0800, subp. 9(A). [Minn. R. 7007.0800, subp. 9(A)]
TFAC 1	1450	The Permittee shall comply with the General Conditions listed in Minn. R. 7007.0800, subp. 16. [Minn. R. 7007.0800, subp. 16]
TFAC 1	1460	Performance Testing: Conduct all performance tests in accordance with Minn. R. ch. 7017 unless otherwise noted in this permit. [Minn. R. ch. 7017]
TFAC 1	1470	Performance Test Notifications and Submittals: Performance Test Notification and Plan: due 30 days before each Performance Test Performance Test Pre-test Meeting: due seven days before each Performance Test Performance Test Report: due 45 days aGer each Performance Test The Notification, Test Plan, and Test Report must be submitted in a format specified by the commissioner. [Minn. R. 7017.2017, Minn. R. 7017.2030, subps. 1-4, Minn. R. 7017.2035, subps. 1-2]
TFAC 1	1480	Limits set as a result of a performance test (conducted before or after permit issuance) apply until superseded as stated in the MPCA's Notice of Compliance letter granting preliminary approval. Preliminary approval is based on formal review of a subsequent performance test on the same unit as specified by Minn. R. 7017.2025, subp. 3. The limit is final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025, subp. 3]

SI Id	Sequence	Requirement
TFAC 1	1490	Monitoring Equipment Calibration - The Permittee shall either: 1. Calibrate or replace required monitoring equipment every 12 months; or 2. Calibrate at the frequency stated in the manufacturer's specifications. For each monitor, the Permittee shall maintain a record of all calibrations, including the date conducted, and any corrective action that resulted. The Permittee shall include the calibration frequencies, procedures, and manufacturer's specifications (if applicable) in the Operations and Maintenance Plan. Any requirements applying to continuous emission monitors are listed separately in this permit. [Minn. R. 7007.0800, subp. 4(D)]
TFAC 1	1500	Operation of Monitoring Equipment: Unless noted elsewhere in this permit, monitoring a process or control equipment connected to that process is not necessary during periods when the process is shutdown, or during checks of the monitoring systems, such as calibration checks and zero and span adjustments. If monitoring records are required, they should reflect any such periods of process shutdown or checks of the monitoring system. [Minn. R. 7007.0800, subp. 4(D)]
TFAC 1	1510	Recordkeeping: Retain all records at the stationary source, unless otherwise specified within this permit, for five (5) years from the date of monitoring, sample, measurement, or report. Records which must be retained at this location include all calibration and maintenance records, all original recordings for continuous monitoring instrumentation, and copies of all reports required by the permit. Records must conform to the requirements listed in Minn. R. 7007.0800, subp. 5(A). [Minn. R. 7007.0800, subp. 5(C)]
TFAC 1	1520	Recordkeeping: Maintain records describing any insignificant modifications (as required by Minn. R. 7007.1250, subp. 3) or changes contravening permit terms (as required by Minn. R. 7007.1350, subp. 2), including records of the emissions resulting from those changes. [Minn. R. 7007.0800, subp. 5(B)]
TFAC 1	1530	If the Permittee determines that no permit amendment or notification is required prior to making a change, the Permittee must retain records of all calculations required under Minn. R. 7007.1200. For non-expiring permits, these records shall be kept for a period of five years from the date that the change was made. The records shall be kept at the stationary source for the current calendar year of operation and may be kept at the stationary source or office of the stationary source for all other years. The records may be maintained in either electronic or paper format. [Minn. R. 7007.1200, subp. 4]
TFAC 1	1610	Shutdown Notifications: Notify the commissioner at least 24 hours in advance of a planned shutdown of any control equipment or process equipment if the shutdown would cause any increase in the emissions of any regulated air pollutant. If the Permittee does not have advance knowledge of the shutdown, the Permittee must notify the commissioner as soon as possible after the shutdown. However, notification is not required in the circumstances outlined in items A, B, and C of Minn. R. 7019.1000, subp. 3. At the time of notification, the owner or operator must inform the commissioner of the cause of the shutdown and the estimated duration. The owner or operator must notify the commissioner when the shutdown is over. [Minn. R. 7019.1000, subp. 3]
TFAC 1	1620	Breakdown Notifications: Notify the commissioner within 24 hours of a breakdown of more than one hour of any control equipment or process equipment if the breakdown causes any increase in the emissions of any regulated air pollutant. The 24-hour time period starts when the breakdown was discovered or reasonably should have been discovered by the owner or operator. However, notification is not required in the circumstances outlined in items A, B, and C of Minn. R. 7019.1000, subp. 2. At the time of notification or as soon as possible thereafter, the Permittee must inform the commissioner of the cause of the breakdown and the estimated duration. The Permittee must notify the commissioner when the breakdown is over. [Minn. R. 7019.1000, subp. 2]

SI Id	Sequence	Requirement
TFAC 1	1630	Notification of Deviations Endangering Human Health or the Environment: Immediately after discovery of the deviation or immediately after when the deviation reasonably should have been discovered, notify the commissioner either orally or by e-mail, or telephone the state duty officer at 800-422-0798 or 651-649-5451, of any deviation from permit conditions that could endanger human health or the environment. [Minn. R. 7019.1000, subp. 1]
TFAC 1	1640	Notification of Deviations Endangering Human Health or the Environment Report: Within two working days of discovery, notify the commissioner in writing of any deviation from permit conditions that could endanger human health or the environment. Include the following information in this written description: 1. the cause of the deviation; 2. the exact dates of the period of the deviation, if the deviation has been corrected; 3. whether or not the deviation has been corrected; 4. the anticipated time by which the deviation is expected to be corrected, if not yet corrected; and 5. steps taken or planned to reduce, eliminate, and prevent reoccurrence of the deviation. [Minn. R. 7019.1000, subp. 1]
TFAC 1	1650	The Permittee must submit a semiannual deviations report : Due semiannually, by the 30th of January and July. The first semiannual report submitted by the Permittee must cover the calendar half-year in which the permit is issued. The first report of each calendar year covers January 1 - June 30. The second report of each calendar year covers July 1 - December 31. Submit this on form DRF-2 (Deviation Reporting Form). If no deviations have occurred, submit the signed report certifying that there were no deviations. [Minn. R. 7007.0800, subp. 6(A), Minn. R. 7007.0800, subp. 6(B)(2)]
TFAC 1	1660	Relocation Notification Form: due 48 hours before change in location. Submit notification on a form approved by the Commissioner. [Minn. R. 7007.0800, subp. 12(C)]
TFAC 1	1670	Application for Permit Amendment: If a permit amendment is needed, submit an application in accordance with the requirements of Minn. R. 7007.1150 through Minn. R. 7007.1500. Submittal dates vary, depending on the type of amendment needed. Upon adoption of a new or amended federal applicable requirement, and if there are three or more years remaining in the permit term, the Permittee shall file an application for an amendment within nine months of promulgation of the applicable requirement, pursuant to Minn. R. 7007.0400, subp. 3. [Minn. R. 7007.0400, subp. 3, Minn. R. 7007.1150 - 7007.1500]
TFAC 1	1680	Extension Requests: The Permittee may apply for an Administrative Amendment to extend a deadline in a permit by no more than 120 days, provided the proposed deadline extension meets the requirements of Minn. R. 7007.1400, subp. 1(H). Performance testing deadlines from the General Provisions of 40 CFR pt. 60 and pt. 63 are examples of deadlines for which the MPCA does not have authority to grant extensions and therefore do not meet the requirements of Minn. R. 7007.1400, subp. 1(H). [Minn. R. 7007.1400, subp. 1(H)]
TFAC 1	1700	The Permittee must submit a compliance certification : Due annually, by the 31st of January (for the previous calendar year). Submit this on form CR-04 (Annual Compliance Certification Report). This report covers all deviations experienced during the calendar year. If no deviations have occurred, submit the signed report certifying that there were no deviations. [Minn. R. 7007.0800, subp. 6(A), Minn. R. 7007.0800, subp. 6(D)]
TFAC 1	1703	Within 15 days of a request from the Commissioner, the Permittee must provide a complete summary of all performance tests required at the facility including the subject item, pollutant, most recent test date (if applicable), and the date of the next test in an approved format. [Minn. R. 7007.0800, subp. 16(L)]

SI Id	Sequence	Requirement
TFAC 1	1706	The Permittee shall submit an annual report by the 31st of January. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The report shall describe the changes made at the facility during the previous calendar year using the latest MPCA application forms. The report shall include information for any new, modified, or replaced Subject Items in the form of a revised Attachment 2 - Subject Item Summary. The report shall include the changes in emissions of any pollutants that have been listed as chemicals of potential interest (COPI) based on the current Air Emission Risk Analysis (AERA) Guidance. The description of the change must include the change in emissions and identification of the emission source that changed. The report shall be submitted with the annual Compliance Certification required by this permit. As part of the Annual Report, the Permittee shall verify and certify that the facility has maintained minor source status for New Source Review. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TFAC 1	1730	Emission Inventory Report: due on or before April 1 of each calendar year following permit issuance. Submit in a format specified by the Commissioner. [Minn. R. 7019.3000-7019.3100]
TFAC 1	1740	Emission Fees: due 30 days after receipt of an MPCA bill. [Minn. R. 7002.0005-7002.0085]
TFAC 1	1890	Modeled Parameters for PM10, PM2.5, NO2, and lead NAAQS: The parameters used in NAAQS modeling for Permit No. 12300341-101 are listed in Appendix C of this permit. The parameters describe the operation of the facility at maximum permitted capacity. The purpose of listing the parameters in the appendix is to provide a benchmark for future changes. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2110	Modeled Parameters for Air Emissions Risk Analysis (AERA): The parameters for 1,2-(trans-) Dichloroethylene and lead used in the AERA for Permit No. 12300341-101 are listed in Appendix C of this permit. The parameters describe the operation of the facility at maximum permitted capacity. The purpose of listing the parameters in the appendix is to provide a benchmark for future changes. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2111	Equivalent or Better Dispersion (EBD) Modeling Triggers (Modeling Submittal Not Required before the change): Changes that do not require a permit amendment or require an administrative permit amendment do not trigger the EBD Modeling Submittal requirement before the change can be made. The Permittee shall keep updated records on site of all modeled PM10, PM2.5, NO2, and lead parameters and emission rates listed in Appendix C. The updated EBD modeling results must demonstrate compliance with NAAQS for the modeled pollutant. The Permittee shall submit any changes to modeled parameters and emission rates with the next required modeling submittal. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2112	Updated AERA Triggers (AERA Submittal Not Required before the change): Changes that do not require a permit amendment or require an administrative permit amendment do not trigger the Updated AERA Submittal requirement before the change can be made. The Permittee shall keep updated records on site of all 1,2-(trans-) Dichloroethylene, lead, and other air toxics parameters and emission rates listed in Appendix C. The updated AERA results must demonstrate compliance with the health benchmarks for the modeled pollutants. The Permittee shall submit any changes to AERA parameters and emission rates with the next required AERA submittal. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2120	Equivalent or Better Dispersion (EBD) Modeling Triggers (Modeling Required): Any changes that affect any modeled PM10, PM2.5, NO2, and lead parameter or emission rate listed in Appendix C, or an addition to the information documented in Appendix C, trigger the EBD Remodeling Submittal requirement. This includes changes that do not require a permit amendment as well as changes that require any type of permit amendment. The updated EBD modeling results must demonstrate compliance with NAAQS for the modeled pollutant. The schedule for EBD Remodeling submittal is defined elsewhere in this permit. Changes made under the Administrative amendment process are excluded from this requirement. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]

SI Id	Sequence	Requirement
TFAC 1	2130	Updated AERA Triggers (AERA Required): Any changes that affect 1,2-(trans-) Dichloroethylene, lead, and other air toxics parameter or emission rate listed in Appendix C, or an addition to the information documented in Appendix C, or the health benchmarks for any of the evaluated chemical of concern have changed to more strict values, or there are new health benchmark values for chemicals of concern used at the facility, trigger the Updated AERA Submittal requirement. This includes changes that do not require a permit amendment as well as changes that require any type of permit amendment. The updated AERA results must demonstrate compliance with the health benchmarks for the modeled pollutants. The schedule for the revised AERA submittal is defined elsewhere in this permit. Changes made under the Administrative amendment process are excluded from this requirement. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2140	EBD Modeling Submittal at Reissuance: The Permittee shall submit an EBD Modeling Submittal with the permit reissuance application (due as stated elsewhere in this permit) that addresses any changes made during the permit term that did not require a permit amendment but that affected any modeled PM10, PM2.5, NO2, and lead parameter or emission rate documented in Appendix C, or an addition to the information documented in Appendix C and that did not trigger the EBD Modeling Triggers (Modeling Required) requirement. [Minn. R. 7007.0800, A) & (B, Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2150	Updated AERA Submittal at Reissuance: The Permittee shall submit an Updated AERA Submittal with the permit reissuance application (due as stated elsewhere in this permit) that addresses any changes made during the permit term that did not require a permit amendment but that affected any 1,2-(trans-) Dichloroethylene, lead, and other air toxics parameter or emission rate documented in Appendix C, or an addition to the information documented in Appendix C and that did not trigger the Updated AERA Triggers (AERA Required) requirement. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2160	EBD Modeling Submittal: For changes meeting the criteria in the EBD Modeling Triggers (Modeling Required) requirement, the Permittee shall submit an EBD modeling submittal in accordance with the current version of the MPCA Air Dispersion Modeling Guidance and shall wait for written approval (for major amendments, in the form of an issued permit amendment; for moderate amendments, in the form of a construction authorization letter) before making such changes. For changes that do not require a moderate or major amendment, but require a minor permit amendment, written approval of the EBD modeling may be given before permit issuance; however, this approval applies only to the EBD modeling and not to any other changes. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2170	Updated AERA Submittal: For changes meeting the criteria in the Updated AERA Triggers (AERA Required) requirement, the Permittee shall submit an updated AERA submittal in accordance with the current version of the MPCA Air Dispersion Modeling Guidance and shall wait for written approval (for major amendments, in the form of an issued permit amendment; for moderate amendments, in the form of a construction authorization letter) before making such changes. For changes that do not require a moderate or major amendment, but require a minor permit amendment, written approval of the updated AERA may be given before permit issuance; however, this approval applies only to the updated AERA and not to any other changes. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2180	EBD Modeling Submittal Content: The information submitted must include, for stack and vent sources, source emission rate, location, height, diameters, exit velocity, exit temperature, discharge direction, use of rain caps or rain hats, and, if applicable, locations and dimensions of nearby buildings. For non-stack/vent sources, this includes the source emission rate, location, size and shape, release height, and, if applicable, any emission rate scalars, and the initial lateral dimensions and initial vertical dimensions and adjacent building heights. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]

SI Id	Sequence	Requirement
TFAC 1	2190	Updated AERA Submittal Content: The information submitted must include, for stack and vent sources, source emission rate, location, height, diameters, exit velocity, exit temperature, discharge direction, use of rain caps or rain hats, and, if applicable, locations and dimensions of nearby buildings. For non-stack/vent sources, this includes the source emission rate, location, size and shape, release height, and, if applicable, any emission rate scalars, and the initial lateral dimensions and initial vertical dimensions and adjacent building heights. If this information is being submitted with a concurrent EBD modeling submittal, this information only needs to be listed once in the combined submittal. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2191	Outdated EBD Baseline Modeling: Prior to conducting the EBD analysis, the Permittee shall use the current version of the MPCA Air Dispersion Modeling Guidance to determine if the Baseline Modeling (the most recent refined modeling demonstration) is consistent with the current version of the MPCA Air Dispersion Modeling Guidance (not outdated). The Permittee may verify if the Baseline modeling is consistent with current Guidance during the approval process for the modeling protocol. If the Baseline Modeling is outdated, the Permittee shall update the Baseline Modeling to be consistent with the current version of the MPCA Air Dispersion Modeling Guidance. The updated modeling will become the new Baseline Modeling. This requirement does not require the Permittee to complete a new refined modeling demonstration using the revisions made for the EBD demonstration. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2193	Outdated Baseline AERA: Prior to conducting the AERA analysis, the Permittee shall use the current version of the MPCA Air Dispersion Modeling Guidance to determine if the Baseline AERA (the most recent AERA demonstration) is consistent with the current version of the MPCA Air Dispersion Modeling Guidance (not outdated). The permittee may verify if the Baseline AERA is consistent with current Guidance during the approval process for the modeling and AERA protocol. If the Baseline AERA is outdated, the Permittee shall update the Baseline AERA to be consistent with the current version of the MPCA Air Dispersion Modeling Guidance. The updated AERA will become the new Baseline AERA. This requirement does not require the Permittee to complete a new AERA using the revisions made for the EBD demonstration. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	2194	EBD Modeling Results: The dispersion characteristics due to the revisions of the information in Appendix C must be equivalent to or better than the dispersion characteristics modeled in the most recent approved modeling submittal that shows compliance with NAAQS. The Permittee shall demonstrate this equivalency in the proposal. The requirements in this condition do not apply if the permittee has conducted refined modeling using the revised parameters and has demonstrated modeled compliance with the applicable emission limits. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21200	Updated AERA Results: The dispersion characteristics due to the revisions of the information in Appendix C must be equivalent to or better than the dispersion characteristics modeled in the most recent approved modeling submittal that shows modeled compliance with NAAQS and health benchmarks The Permittee shall demonstrate this equivalency in the proposal. The requirements in this condition do not apply if the permittee has conducted refined modeling using the revised parameters and has demonstrated compliance with the applicable emission limits. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]

SI Id	Sequence	Requirement
TFAC 1	21210	Computer Dispersion Modeling Triggers for PM10, PM2.5, NO2, and lead NAAQS: The Permittee shall conduct a refined remodeling analysis in accordance with the Computer Dispersion Modeling requirements of this permit and the current version of the MPCA Air Dispersion Modeling Guidance if: (1) the results of the EBD modeling analysis do not demonstrate equivalent or better dispersion characteristics; (2) a conclusion cannot readily be made about the dispersion, or (3) the criteria in the EBD Modeling Triggers requirement are met and the Permittee has previously conducted three successive EBD analyses using the same Baseline Modeling, unless written approval is obtained from MPCA to get an exception from this maximum number of allowed EBD analyses. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21220	Computer Dispersion Modeling/AERA Protocol: due 180 days after receipt of written MPCA request for PM10, PM2.5, NO2, and/or lead NAAQS, and/or AERA refined modeling. The Permittee shall submit a Computer Dispersion Modeling/AERA Protocol that is complete and approvable by MPCA by the deadline in this requirement. This protocol will describe the proposed modeling methodology and input data, in accordance with the current version of the MPCA Air Dispersion Modeling Guidance. The protocol must be based on projected operating conditions under the next permit term. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21300	Computer Dispersion Modeling/AERA Protocol: due 60 days after receipt of written MPCA request for revisions to the submitted protocol for PM10, PM2.5, NO2, and/or lead NAAQS, and/or AERA modeling. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21310	Computer Dispersion Modeling/AERA Results: due 180 days after receipt of written MPCA approval of Computer Dispersion Modeling Protocol for PM10, PM2.5, NO2, and/or lead NAAQS, and/or AERA. The Permittee shall submit a final Computer Dispersion Modeling Report that is complete and approvable by MPCA by the deadline in this requirement. The submittal shall adhere to the current version of the MPCA Air Dispersion Modeling Guidance and the approved Computer Dispersion Modeling Protocol. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21330	The Permittee shall continue to conduct VOC and TO-15 Ambient Air Monitoring that was required my MPCA before issuance of Permit No. 12300341-101. Ambient air monitoring shall be conducted in accordance with the MPCA-approved VOC ambient air monitoring plan in the Administrative Order dated January 17, 2020, and included in this permit as Appendix F. This monitoring plan shall continue until the time the MPCA approves a revised ambient monitoring plan. The permittee shall compile 24-hour VOC and TO-15 monitoring results by the last day of each month for the previous monitoring month. The results shall be reported to AQRoutineReport.PCA.state.mn.us and made available to MPCA at any other time. [Minn. R. 7007.0800, subp. 2, Minn. R. 7009.0010-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21331	The Permittee shall submit a revised ambient monitoring plan for VOC and TO-15 Ambient Air Monitoring due within 30 days of permit issuance. The revised ambient monitoring protocol shall address the following as described in Appendix H 1) Number and locations of monitoring sites following EPA siting requirements. 2) Sampling frequency 3) Data submittal frequency 4) TO-15 analytes include 1,2-(trans-) Dichloroethylene. [Minn. R. 7007.0800, subp. 2, Minn. R. 7009.0010-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21332	The Permittee shall submit a revised Ambient Monitoring Plan: due 60 calendar days after Date of Receipt of written MPCA request for revisions to the submitted Ambient Air Monitoring Plan for VOC and TO-15. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0010-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21333	The Permittee shall conduct VOC and TO-15 Ambient Air Monitoring due within 30 days following approval of revised ambient air monitoring plan. Ambient air monitoring shall be conducted in accordance with the MPCA-approved Revised VOC ambient air monitoring plan. The VOC and TO-15 ambient monitoring may not be interrupted during the transition of ambient monitoring to the revised plan. [Minn. R. 7007.0800, subp. 2, Minn. R. 7009.0010-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]

SI Id	Sequence	Requirement
TFAC 1	21338	Discontinuation of VOC Ambient Air Monitoring: The Permittee shall operate and maintain the VOC ambient air monitoring network according to the MPCA approved Ambient Air Monitoring Plan until the Commissioner determines that the following criteria have been met: 1) Twenty four months of ambient air monitoring is conducted pursuant to the Ambient Air Monitoring Plan approved by MPCA and implemented as prescribed elsewhere in this permit; 2) The twenty four months of ambient monitoring shall exclude periods when Water Gremlins shuts down t-DCE coating operations so that the length of the ambient monitoring period represents 24 months of measured ambient concentrations during actual coating operation with t-DCE containing materials. 3) There are no violations of the 1,2-(trans-) Dichloroethylene emission limit during the 24 months of actual coating operation; 4) The facility's 1,2-(trans-) Dichloroethylene emissions are at least 80 percent of the permitted limit during the ambient air monitoring period; 5) The probability of future long-term average 1,2-(trans-) Dichloroethylene concentrations being above health guidelines is less than 5 percent. The Permittee shall test this requirement by calculating a 95 percent upper confidence limit for the mean concentration at each monitoring site and compare the highest 95 percent upper confidence limit to 80 percent of the health benchmark for 1,2-(trans-) Dichloroethylene, as adapted from EPA Ambient Air Monitoring Network Assessment Guidance (Section 4.1). If the calculated 95 percent upper confidence limit is below 80 percent of the inhalation health benchmark for 1,2-(trans-) Dichloroethylene, ambient air monitoring may be discontinued if all other criteria are met; and 6) The permit contains limits that restrict t-DCE/VOC emissions, based on modeled concentrations below inhalation health benchmarks as approved by MPCA. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21340	General Public Preclusion Plan - Boundary Map Within 180 days after Permit Issuance, the Permittee shall use fencing, control access points, restriction signage, and remote monitoring as specified in Appendix G to maintain control over the fence line. Appendix G to this permit is a map that depicts the boundary at which the access of the general public can be controlled and compliance with the National Ambient Air Quality Standards (NAAQS) can be demonstrated. Appendix G identifies the forms of control the Permittee will use to restrict access to the general public along portions of the fence line. The general public does not include employees or other categories of people who have been directly authorized by the property owner to enter or remain on the property for a limited period of time and for a specific purpose. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7007.0800, subp. 4(D), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TFAC 1	21341	General Public Preclusion Plan This Plan shall, at a minimum, contain the following information: 1. A map of the facility that clearly displays the ambient air boundary. The map must indicate how access is precluded for each section of the boundary and must identify all access points (including roadways, power lines, rail spurs, etc.); 2. Locations where fencing will be implemented; 3. Restriction signage spacing (restriction signage may include notices such as "No Trespassing," "Private Property," "Do Not Enter," or "Restricted Area"); 4. Location of remote monitoring devices; 5. Operation and maintenance requirements of remote monitoring soGware and devices; 6. Contingency plans for downtime for remote monitoring soGware and devices; and 7. A response plan for when breaches occur. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7007.0800, subp. 4(D), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
TFAC 1	21342	Recordkeeping for Breaches of the Ambient Air Boundary Within three facility operating days of each observed breach, the Permittee shall document each instance that the ambient air boundary was breached by a member of the general public, including documenting the type, location, and duration of each breach. The Permittee shall identify and, within 30 days, implement measures to prevent future breaches, if necessary. A breach to the ambient boundary occurs when a member of the general public accesses property identified by the Permittee as non-ambient air other than by invitation, request or for other facility authorized business purposes. The observation of a breach may be direct or indirect. A direct observation includes witnessing a member of the general public on property identified as non-ambient air. Indirect observations rely on evidence of a breach, such as a cut fence, worn paths, motorized vehicle tracks, or other signs of disturbance by a member of the general public on property identified as non-ambient air. The Permittee shall report each breach, including all steps taken or changes made to the General Public Preclusion Plan to prevent additional breaches, in the semiannual Deviations Report required by this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7007.0800, subp. 4(D), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
TFAC 1	21343	General Public Preclusion Plan - Fencing: The Permittee shall install and maintain fencing along ambient air boundary as depicted in Appendix G. The Permittee shall inspect the fence line once per quarter. The Permittee shall maintain records of inspection and required maintenance of fence line. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7007.0800, subp. 4(D), Minn. R. 7007.0800, subp. 5, Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TFAC 1	21345	General Public Preclusion Plan - Remote Monitoring: The Permittee shall operate and maintain remote monitoring equipment to maintain the effective fence line as depicted in Appendix G. The Permittee shall monitor at a minimum of once per day. Remote monitoring devices include but are not limited to fixed cameras and drone mounted cameras. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7007.0800, subp. 4(D), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TFAC 1	21346	The Permittee shall submit a monthly Ambient Air Monitoring Report: due within 30 calendar days following the last day of each month after Initial Startup of the VOC monitors in accordance with the MPCA-approved Monitoring Plan. The report shall be certified by the responsible official as defined in Minn.R. 7007.0100, subp. 21(A). The VOC monitoring results shall be submitted to AQRoutineReport@pca.state.mn.us within 30 calendar days following the last day of the month following startup of the VOC monitors. [Minn. R. 7007.0800, subps. 5-6]
TFAC 1	21347	The Permittee shall submit excess emission/downtime report: Due 30 days after the end of each calendar quarter following permit issuance. Submit this on form DRF-1 (Excess Emissions Reporting) as amended. The EER shall indicate all periods of monitor bypass and exceedances of the limit including those allowed by an applicable standard, i.e. during startup, shutdown, and malfunctions, as well as a summary of audit results and frequencies. If no excess emissions, downtime or bypasses occurred during the quarter, submit a signed report supplying the necessary monitor data needed to verify this. [Minn. R. 7017.1110, subps. 1-2]
TFAC 1	21348	The Permittee shall submit a notification of the actual Date of Initial Startup due 15 calendar days after Initial Startup Date of the VOC monitors, as described in the approved revised ambient air monitoring plan. [Minn. R. 7007.0800, subp. 6]

SI Id	Sequence	Requirement
TFAC 1	21349	The Permittee shall submit a 1,2-(trans-) Dichloroethylene VOC Solvent Usage Report due within 30 calendar days following the last day of each month. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The t-DCE VOC solvent usage report shall include tons per month of t-DCE containing solvent used and tons per month of t-DCE VOC emissions from 1,2-(trans-) Dichloroethylene containing solvent used. The report shall include any audit of t-DCE VOC solvent usage conducted during that month as a result of the t-DCE Quarterly Purchase Audit required elsewhere in this permit. The report shall be submitted to AQRoutineReport@pca.state.mn.us. This requirement to report on a monthly basis expires when MPCA approves discontinuation of VOC Ambient Air Monitoring. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subps. 5-6]
TFAC 1	21350	The Permittee shall submit a VOC Continuous Emission Monitor Report due within 30 calendar days following the last day of each month. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The VOC Continuous Emission Monitor report shall report daily emissions as measured ppmv-Wet of Total Hydrocarbon Concentration as 1,2-(trans-) Dichloroethylene based on daily CEM readings. The report shall include any audit of t-DCE VOC solvent usage conducted during that month as a result of the Reconciliation of Predicted Stack Concentration and CEMS Readings required elsewhere in this permit. The report shall be submitted to AQRoutineReport@pca.state.mn.us. This requirement to report on a monthly basis expires when MPCA approves discontinuation of VOC Ambient Air Monitoring. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subps. 5-6, Minn. Stat. 116.07, subd. 9(2)]
TFAC 1	23144	General Public Preclusion Plan - Control of Access: The Permittee shall control access at any road, trail equal to or wider than 50 inches, and all abandoned railroad grades. The Permittee shall secure these access points with a locked and/or monitored gate or other physical barrier precluding access by the general public. The permittee may submit an alternative plan for control access to replace these requirements. Upon MPCA approval, the permittee may follow the approved control access plan in lieu of the "General Public Preclusion Plan - Control of Access" requirements in this permit, The alternative plan to control access must be implemented within 180 days after MPCA approval. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7007.0800, subp. 4(D), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TFAC 1	23145	The permittee shall comply with National Primary and Secondary Ambient Air Quality Standards, 40 CFR pt. 50, and the Minnesota Ambient Air Quality Standards, Minn. R. 7009.0010 to 7009.0090. Compliance shall be demonstrated upon written request by the MPCA. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TFAC 1	23146	Commercial Disclosure Regarding Facility Emissions Into the Community: The Permittee shall conduct a meeting annually to disclose factual information to the community regarding facility operations, changes made or planned to reduce air emissions, management of hazardous materials and compliance with environmental permits and regulations. The Permittee shall provide the time, date, location, format, and agenda of the meeting to the MPCA 60 days before the meeting. [Minn. R. 7007.0800, subp. 2(B), Minn. Stat. 116.07, subd. 9(2)]
TFAC 1	23147	The responsible official that certifies the submittals required to be certified by rule and by this permit must meet the definition at Minn. R. 7007.0100, subp. 21. The Permittee must obtain approval of delegation of authority for the designated representative by the Commissioner as required by Minn. R. 7007.0100, subp. 21(A), (B) or (C). The certification statements must meet the requirements in Minn. R. 7007.0500 subp. 3. [Minn. R. 7007.0100, subp. 21, Minn. R. 7007.0800, subp. 6(A)]
COMG 1	3855	The Permittee shall submit an annual report by the 31st of January. The report shall document the VOC 365-day rolling sum calculations for the previous calendar year. The report shall be submitted with the annual Compliance Certification required by this permit. As part of the Annual Report, the Permittee shall verify and certify that the Facility has maintained minor source status for PSD and Part 70. [Minn. R. 7007.0800, subp. 2(A)]

SI Id	Sequence	Requirement
COMG 1	3900	The Permittee shall limit emissions of Volatile Organic Compounds <= 90.0 tons per year 12-month rolling sum to be calculated each operating day for the previous 12-month period as described later in this permit. All VOC-emitting equipment in COMG 1 is subject to this limit. VOC emissions shall be calculated based on the method described elsewhere in this permit. VOC content for each VOC-containing material shall be determined as described under the Material Content requirement in Appendix B. VOC emissions shall be calculated based on all VOC, Water Based and UV Coaters. VOC content for each VOC-containing material shall be determined as described under the Material Content requirement in Appendix B. The Permittee may take into account the VOCs from coating operations that exit the facility as waste as described under the Waste Credit for Calculation of VOC Emissions requirement in COMG 1. [Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 1	3910	The Permittee shall limit emissions of 1,2-(trans-) Dichloroethylene <= 32.6 tons per year 365-day rolling sum to be calculated each operating day for the previous 365-day period as described later in this permit. All 1,2-(trans-) Dichloroethylene-emitting equipment and operations at the facility is subject to this limit. 1,2-(trans-) Dichloroethylene emissions shall be calculated based on the methods described elsewhere in this permit. 1,2-(trans-) Dichloroethylene content in VOC-containing material shall be determined by assuming the entire VOC content is 1,2-(trans-) Dichloroethylene as described under the Material Content requirement in Appendix B. The 1,2-(trans-) Dichloroethylene emissions released outside the coating rooms must also be included as described elsewhere in this permit. The calculation of 1,2-(trans-) Dichloroethylene emissions may take into account the 1,2-(trans-) Dichloroethylene that exits the facility as waste as described under the Waste Credit requirement in COMG 1, but only if the Permittee separately quantifies the specific 1,2-(trans-) Dichloroethylene content in the waste material as described elsewhere in this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	3920	1,2-(trans-) Dichloroethylene Quarterly Purchase Audit: Each calendar quarter, the Permittee shall audit purchase records and existing inventory of 1,2-(trans-) Dichloroethylene VOC-containing material, 1,2-(trans-) Dichloroethylene VOC-containing material usage records and keep records of each audit. If the estimates of use of 1,2-(trans-) Dichloroethylene VOC-containing material based on the purchase and inventory audit shows amounts of use 20 percent or greater than what was calculated based on daily usage logs described elsewhere in the permit, the Permittee shall review and correct as needed the procedures for the daily record keeping of use of 1,2-(trans-) Dichloroethylene VOC-containing material. The audit and records of corrections shall be made available for inspection upon request. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 1	4040	Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total weight of each VOC-containing material used in coating operations. This shall be based on written usage logs. Written usage logs shall include all data and calculations used to obtain the recorded weight(s) of each VOC-containing material used. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
COMG 1	4050	Volatile Organic Compounds: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate, record, and maintain a record of the following for the previous operating day: 1) total weight of each VOC coating and solvent used in COMG 1 , in tons; 2) total weight of each VOC-containing material used in COMG 1 , including fresh solvent and solvent recovered on-site from the distiller, in tons; 3) total weight of VOC-containing material recovered on-site from the distiller, in tons; 4) total weight of water-based coating used in COMG 1 , in tons; 5) total weight of UV coating used in COMG 1 , in tons; 6) total weight of VOC-containing material that leaves the facility as waste according to the Waste Credit requirement if taking credit for compliance with the VOC emission limit, in tons; 7) daily VOC emissions for all equipment in COMG 1 for the previous operating day using the formulas specified elsewhere in this permit; and 8) 365-day rolling sum VOC emissions for all equipment in COMG 1 for the previous 365 day period by summing the daily VOC emissions data for the previous 365 days. [Minn. R. 7007.0800, subps. 4-5]
COMG 1	4055	1,2-(trans-) Dichloroethylene: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) total weight of each 1,2-(trans-) Dichloroethylene coating and solvent used in COMG 1 , in tons; 2) total weight of 1,2-(trans-) Dichloroethylene used in COMG 1, assuming the entire VOC content in the coating and solvent material is 1,2-(trans-) Dichloroethylene, in tons. This shall include fresh solvent and solvent recovered on-site from the distiller; 3) total weight of 1,2-(trans-) Dichloroethylene VOC-containing material recovered on-site from the distiller, in tons; 4) total weight of 1,2-(trans-) Dichloroethylene recovered from the distiller following the procedures in Appendix B to determine the 1,2-(trans-) Dichloroethylene content in material recovered on-site from the distiller, in tons; 5) total weight of 1,2-(trans-) Dichloroethylene VOC-containing material that left the facility as waste if taking credit for compliance with the 1,2-(trans-) Dichloroethylene emission limit, in tons; 6) total weight of 1,2-(trans-) Dichloroethylene that left the facility as waste following the procedures in Appendix B to determine the 1,2-(trans-) Dichloroethylene content if taking credit for compliance with the 1,2-(trans-) Dichloroethylene emission limit, in tons; 7) total weight of fugitive 1,2-(trans-) Dichloroethylene emissions based on measured indoor air concentrations in non-coating rooms using the concentrations and procedures in Appendix B, in tons; 8) total weight of 1,2-(trans-) Dichloroethylene emissions using the formulas specified in this permit; and 9) 365-day rolling sum of 1,2-(trans-) Dichloroethylene emissions for the previous 365 day period by summing the daily 1,2-(trans-) Dichloroethylene emissions data for the previous 365 days. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]

SI Id	Sequence	Requirement
COMG 1	4060	The Permittee shall calculate VOC emissions using the following equations: VOC (tons/month) = V - W V = (A1 x B1) + (A2 x B2) + (A3 x B3) +.....+ (C1 x D1) + (C2 x D2) + (C3 x D3).....+ (E1 x F1) + (E2 x F2) + (E3 x F3) +..... W = (G1 x H1) + (G2 x H2) + (G3 x H3) +..... Where: V = total weight of VOC used, in tons/month; A# = total weight of VOC-containing material used in COMG 1 based on daily usage logs, in tons/month. The VOC containing material weight must include the initial weight of prepared coating in each coater-specific tank as well as the weight of solvent added to each tank to thin out the coating; B# = weight percent VOC in A# defined in Appendix B, as a fraction. The weight percent for the formulation allowed by this permit is 0.90 lb VOC/lb solvent. The requirements to approve the use of other formulations and emission factors are defined elsewhere in this permit; C# = total weight of UV coating used in COMG 1 based on daily usage logs, in tons/month; D# = VOC emission factor for UV coating, as lb VOC/lb coating. The emission factor for UV coating allowed by this permit 0.0031 lb VOC/lb coating. The requirements to approve the use of other VOC emission factors are defined elsewhere in this permit. E# = total weight of each water-based coating used in COMG 1 based on daily usage logs, in tons/month; F# = VOC emission factor from water-based coating, as lb VOC/lb coating. The emission factor for water-based coating allowed by this permit 0.0057 lb VOC/lb coating. The requirements to approve the use of other VOC emission factors are defined elsewhere in this permit. W = total weight of VOC shipped in waste, in tons/month; G# = total weight of each VOC-containing waste material shipped based on daily usage logs, in tons/month. If the Permittee chooses to not take credit for waste shipments, this parameter would be zero; and H# = weight percent of VOC in G#, defined in Appendix B and the Waste Credit requirement in COMG 1, as a
COMG 1	4065	1,2-(trans-) Dichloroethylene: Daily Calculations. The Permittee shall calculate 1,2-(trans-) Dichloroethylene emissions using the following equations: 1,2-(trans-) Dichloroethylene (tons/day) = T - X T = (I1 x J1) + (I2 x J2) + (I3 x J3) +.....+ K X = (M1 x N1) + (M2 x N2) + (M3 x N3) +..... Where: T = total weight of 1,2-(trans-) Dichloroethylene used, in tons/day; I# = total weight of 1,2-(trans-) Dichloroethylene VOC-containing material used in COMG 1 based on daily usage logs, in tons/day. The 1,2-(trans-) Dichloroethylene VOC-containing material weight must include the initial weight of prepared coating in each coater-specific tank as well as the weight of 1,2-(trans-) Dichloroethylene VOC solvent added to each tank to thin out the coating; J# = weight percent of 1,2-(trans-) Dichloroethylene in I# defined in Appendix B, as a fraction. The weight percent for the formulation allowed by this permit is 0.90 lb 1,2-(trans-) Dichloroethylene /lb solvent. The requirements to approve the use of other formulations and emission factors are defined elsewhere in this permit; X = total weight of 1,2-(trans-) Dichloroethylene shipped in waste, in tons/day; M# = total weight of 1,2-(trans-) Dichloroethylene VOC-containing material shipped in waste based on daily usage logs, in tons/day. If the Permittee chooses to not take credit for waste shipments, this parameter would be zero; N# = weight percent of 1,2-(trans-) Dichloroethylene in M#, as a fraction, as determined in Appendix B and by the Waste Credit requirements elsewhere in this permit; K = default daily uncaptured 1,2-(trans-) Dichloroethylene emissions based on measured indoor air concentrations of non-coating rooms, in tons/day, as described elsewhere in this permit; and. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
COMG 1	4070	Daily Reporting: The Permittee shall continue to comply with the requirements of all effective enforcement documents until those documents are terminated by MPCA. As of issuance of Permit No. 12300341-101, these enforcement documents include the Stipulation Agreement executed March 1, 2019, and the Administrative Order signed January 17, 2020. These documents are included for reference as Attachments 5 and 6 to the TSD of this permit, respectively. [Minn. R. 7007.0800, subp. 2(A) & (B)]
COMG 1	4075	1,2-(trans-) Dichloroethylene: Default Uncaptured Emission Rate. The Default Uncaptured Emission Rate to be used based on measured indoor air concentrations in non-coating rooms for the purposes of calculating total daily 1,2-(trans-) Dichloroethylene emissions are defined as follows: Default 1,2-(trans-) Dichloroethylene Uncaptured Emission Rate = 0.00324 tons/day The Permittee shall add this value (K) to the total daily 1,2-(trans-) Dichloroethylene emissions following the requirements of this permit. The Permittee may change the default uncaptured emission rate following the requirements specified in this permit and the procedures in Appendix B. [Minn. R. 7007.0800, subps. 4-5]
COMG 1	4080	1,2-(trans-) Dichloroethylene: Changes to Default Uncaptured Emission Rates. The Permittee may change the default uncaptured emission rate based on approved indoor testing of non-coating rooms at the facility identified in Appendix B. The revised emission rates shall be calculated as follows: DFE = (Y1 x Z1) + (Y2 x Z2) + (Y3 x Z3) +..... where: DFE = Default Uncaptured Emission rate of 1,2-(trans-) Dichloroethylene, in tons/day; Y# = concentration of 1,2-(trans-) Dichloroethylene measured in each non-coating room at the facility described in Appendix B, in tons/actual cubic foot; and Z# = total actual flow rate of all vents associated with each non-coating room at the facility, in actual cubic feet/day. [Minn. R. 7007.0800, subps. 4-5]
COMG 1	4085	1,2-(trans-) Dichloroethylene: Reconciliation of Predicted Stack Concentration and CEMS (EQUI 176) Readings. By 4:30pm each coating operating day, the Permittee shall calculate and record the predicted stack concentration of 1,2-(trans-) Dichloroethylene versus 1,2-(trans-) Dichloroethylene usage the following equation: y = 0.1295x + 49.163 Where: y = predicted 1,2-(trans-) Dichloroethylene stack concentration, in ppmv-wet of Total Hydrocarbon Concentration as 1,2-(trans-) Dichloroethylene; x = 1,2-(trans-) Dichloroethylene usage, in pounds per day, from daily t-DCE containing VOC coating and solvent usage records. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. Stat. 116.07, subd. 9(2)]
COMG 1	4090	Reconciliation of Predicted Stack Concentration and CEMS Readings Audit: If the daily CEMS (EQUI 176) reading exceeds the predicted 1,2-(trans-) Dichloroethylene stack concentration for that day, in ppmv-wet, the Permittee shall immediately audit the 1,2-(trans-) Dichloroethylene-containing material usage and inventory records to determine the cause of this discrepancy and shall report this as a deviation. The Permittee shall implement needed corrections based on this review. The Permittee shall keep records of each calculation, whether a deviation was observed, and whether a correction was made and how the correction was made. [Minn. R. 7007.0800, subps. 4-6, Minn. Stat. 116.07, subd. 9(2)]

SI Id	Sequence	Requirement
COMG 1	6980	Material Content. VOC and Solids (PM, PM<10 microns, and PM<2.5 microns) contents in coating materials shall be determined by the Safety Data Sheet (SDS) or the Material Safety Data Sheet (MSDS) provided by the supplier for each material used. If a material content range is given on the SDS or the MSDS, the highest number in the range shall be used in all compliance calculations. If information is provided in the Regulatory Section of the SDS, the highest number in the range of that section may be used. Other alternative methods approved by the MPCA may be used to determine the VOC and solids contents. The Commissioner reserves the right to require the Permittee to determine the VOC and solids contents of any material, according to EPA or ASTM reference methods. If an EPA or ASTM reference method is used for material content determination, the data obtained shall supersede the SDS or the MSDS. [Minn. R. 7007.0800, subps. 4-5]
COMG 1	6990	Maximum Contents of Materials and Process Rate: The Permittee assumed certain worst-case contents of materials and process rates when determining the short-term potential to emit of units in COMG 1. These assumptions are listed in Appendix B and Appendix C of this permit. Increasing the process rate or changing to a material that has a higher content of any of the given pollutants, or an addition of a pollutant not listed in Appendix B or Appendix C, is considered a change in method of operation that must be evaluated under Minn. R. 7007.1200, subp. 3 to determine if a permit amendment or notification is required under Minn. R. 7007.1150. [Minn. R. 7005.0100, subp. 35a]
COMG 1	7000	Waste Credit for Calculation of VOC Emissions: If the Permittee elects to obtain credit for VOC shipped in waste materials, the Permittee shall either use item 1 or 2 to determine the VOC content for each credited shipment. 1) The Permittee shall analyze a representative composite sample of each waste shipment to determine the weight content of VOC, excluding water following the procedures in Appendix B. 2) The Permittee may use supplier data for raw materials to determine the VOC contents of each waste shipment, using the same content data used to determine the content of raw materials. If the waste contains several materials, the content of mixed waste shall be assumed to be the lowest VOC content of any of the materials. [Minn. R. 7007.0800, subps. 4-5]
COMG 1	7001	Waste Credit for Calculation of 1,2-(trans-) Dichloroethylene Emissions: If the Permittee elects to obtain credit for 1,2-(trans-) Dichloroethylene shipped in waste materials, the Permittee shall determine the specific content of 1,2-(trans-) Dichloroethylene in waste material, in weight percent, following the analysis procedure and frequency requirements in Appendix B. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 1	7002	Conversion of VOC Spray Coater(s) to VOC Dip/Drip Coater(s). The Permittee is authorized to modify existing spray VOC coaters to dip/drip application methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for VOC coaters described under COMG 1 and COMG 5, and be removed from COMG 4 and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]

SI Id	Sequence	Requirement
COMG 1	7003	Conversion of VOC Spray Coater(s) to Water-Based Spray Coater(s). The Permittee is authorized to modify existing spray VOC coaters to use Tacolyn 3570 water-based coating applied by spray methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for water-based coaters described under COMG 1, COMG 5, and COMG 8, and COMG 14, and be removed from COMG 4 for compliance demonstration purposes. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7004	Conversion of VOC Spray Coater(s) to Water-Based Dip/Drip Coater(s). The Permittee is authorized to modify existing spray VOC coaters to use Tacolyn 3570 water-based coatings applied by dip/drip methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for water-based coaters described under COMG 1 and be removed from COMG 4, COMG 5, and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7005	Conversion of VOC Spray Coater(s) to Ultraviolet (UV) Spray Coater(s). The Permittee is authorized to modify existing VOC spray coaters to use the WGCS 300 UV spray coating method. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for UV coaters described under COMG 1, COMG 2, COMG 5, and COMG 14, and shall be removed from COMG 4 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7006	Conversion of VOC Dip/Drip Coater(s) to Water-Based Spray Coater(s). The Permittee is authorized to modify existing VOC dip/drip coaters to use Tacolyn 3570 water-based coatings applied by spray methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for water-based coaters described under COMG 1, COMG 5, COMG 8, and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]

SI Id	Sequence	Requirement
COMG 1	7007	Conversion of VOC Dip/Drip Coater(s) to Water-Based Dip/Drip Coater(s). The Permittee is authorized to modify existing VOC dip/drip coaters to use Tacolyn 3570 water-based coatings applied by dip/drip methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for water-based coaters described under COMG 1 and be removed from COMG 5 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7010	Conversion of VOC Dip/Drip Coater(s) to Ultraviolet (UV) Spray Coater(s). The Permittee is authorized to modify existing VOC dip/drip coaters to use the WGCS 300 UV spray coating method. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for UV coaters described under COMG 1, COMG 2, COMG 5, and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7011	The Permittee is prohibited from making any of the following changes without a major permit amendment to extend enforcement of the existing emission limit caps and emission calculation methods. The Permittee may submit to MPCA an applicability determination to confirm the need for a major amendment when planning any of the modifications listed below: 1) Converting any type of existing VOC coater to any type of VOC coater in a manner that increases potential emissions of any pollutant; 2) Replacing any type of existing VOC coater with any type of new VOC coater that results in increased emissions; 3) Adding any type of new VOC coater; 4) Converting any type of strictly water-based coater to any type of strictly VOC coater. This does not apply to existing hybrid coaters identified in Appendix B as able to apply water-based and/or VOC coatings; 5) Replacing any type of strictly water-based coater with any type of strictly VOC coater. This does not apply to existing hybrid coaters identified in Appendix B as able to apply water-based and/or VOC coatings; 6) Converting any type of existing UV coater to any type of VOC coater; or 7) Replacing any type of existing UV coater with any type of VOC coater. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]

SI Id	Sequence	Requirement
COMG 1	7012	Conversion of Water-Based Spray Coater(s) to Water-Based Dip/Drip Coater(s). The Permittee is authorized to modify existing water-based spray coaters to use Tacolyn 3570 water-based coatings applied by dip/drip methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for water-based coaters described under COMG 1 and be removed from COMG 8 and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7013	Conversion of Water-Based Dip/Drip Coaters to Water-Based Spray Coaters. The Permittee is authorized to modify existing water-based dip/drip coaters to use Tacolyn 3570 water-based coatings applied by spray methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for water-based coaters described under COMG 1, COMG 5, COMG 8, and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7014	Conversion of Water-Based Spray Coater(s) to Ultraviolet (UV) Spray Coater(s). The Permittee is authorized to modify water-based spray coaters to use the WGCS 300 UV spray coating method. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for UV coaters described under COMG 1, COMG 2, COMG 5, and COMG 14, and be removed from COMG 8 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7015	Conversion of Water-Based Dip/Drip Coater(s) to Ultraviolet (UV) Spray Coater(s). The Permittee is authorized to modify water-based dip/drip coaters to use the WGCS 300 UV spray coating method. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for UV coaters described under COMG 1, COMG 2, COMG 5, and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]

SI Id	Sequence	Requirement
COMG 1	7016	Replacement of Existing Water-Based Spray Coater(s) and Addition of New Water-Based Spray Coater(s). The Permittee is authorized to replace existing water-based spray coaters with new water-based spray coaters, and add additional new water-based spray coaters. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the new coater(s) shall comply with all requirements for water-based spray coaters described under COMG 1, COMG 5, COMG 8, and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7017	Replacement of Existing Water-Based Dip/Drip Coater(s). Change of Location of Water-Based Dip/Drip Coater(s) Outside the Coating Rooms Exhausting Through STRU 73, and Addition of New Water-Based Dip/Drip Coater(s). The Permittee is authorized to replace existing water-based dip/drip coaters with new water-based dip/drip coaters, or change the location of existing water-based dip/drip coaters to a location outside the coating rooms exhausting through STRU 73, or install new water-based dip/drip coaters. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the new coater(s) shall comply with all requirements for water-based coaters described under COMG 1 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7018	Conversion of Ultraviolet (UV) Spray Coater(s) to Water-Based Spray Coater(s). The Permittee is authorized to modify existing UV coaters to use water-based coaters with spray application methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for water-based coaters described under COMG 1, COMG 5, COMG 8, and COMG 14, and be removed from COMG 2 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7019	Conversion of Ultraviolet (UV) Spray Coater(s) to Water-Based Dip/Drip Coater(s). The Permittee is authorized to modify existing UV coaters to use water-based coaters with dip/drip application methods. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the converted coater(s) shall comply with all requirements for water-based coaters described under COMG 1, and be removed from COMG 2, COMG 5, and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]

SI Id	Sequence	Requirement
COMG 1	7020	Replacement of Existing UV Spray Coater(s) and Addition of New UV Spray Coater(s). The Permittee is authorized to replace existing UV coaters with new UV coaters, and add additional new UV coaters. A permit amendment may be needed if there is an increase of regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the new coater(s) shall comply with all requirements for UV coaters described under COMG 1, COMG 2, COMG 5, and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7021	Replacement of Existing VOC Dip/Drip Coater(s). The Permittee is authorized to replace existing VOC dip/drip coater with new VOC dip/drip coater of equal or lower design capacity so that there is no increase of potential emissions of t-DCE. A permit amendment may be needed if there is an increase of other regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the new coater(s) shall comply with all requirements for VOC Dip/Drip coaters described under COMG 1 and COMG 5 for compliance demonstration purposes. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.385, subd. 3]
