COMG 1	7022	Replacement of Existing VOC spray Coater(s). The Permittee is authorized to replace existing VOC spray coater with new VOC dip/drip coater of equal or lower design capacity so that there is no increase of potential emissions of t-DCE or PM10 or PM2.5. A permit amendment may be needed if there is an increase of other regulated pollutants based on the design capacity of the modified equipment, the change will be subject to a newly applicable requirement, or there are revisions to limits or the monitoring and recordkeeping in this permit. If a permit amendment is required for this change, the Permittee shall apply for and obtain the appropriate permit amendment before making the change, as applicable. If no permit amendment is needed, the Permittee shall notify the Agency within 30 days before the change is implemented as required elsewhere in this permit. On the first day of operation, the new coater(s) shall comply with all requirements for VOC spray coaters described under COMG 1, COMG 5, COMG 4 and COMG 14 for compliance demonstration purposes. [Minn. R. 7007.0800, subp. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7023	VOC Solvent Formulation: The Permittee shall limit VOC solvent use to the formulation described in Appendix B of this permit. For authorization to use alternative VOC solvents with formulations that increase emissions of chemicals identified under the Toxicological or Ecological Information section of the Safety Data Sheet, or that add new chemicals not identified in the Toxicological or Ecological Information section of the Safety Data Sheet, or that increase the VOC content above 90 percent (by weight), the Permittee shall submit a major amendment with a revised Air Emissions Risk Analysis (AERA) following procedures as required under Minn. R. 7007.1500. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7024	Water-Based Coating Formulation: The Permittee shall limit use of water-based coating to the formulation described in Appendix B of this permit. For authorization to use other water-based coatings with formulations that increase emissions of any chemical identified under the Toxicological or Ecological Information section of the Safety Data Sheet, or that add new chemicals not identified in the Toxicological or Ecological Information section of the Safety Data Sheet, the Permittee shall submit a major amendment following procedures as required under Minn. R. 7007.1500. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]

SI Id	Sequence	Requirement
COMG 1	7025	Ultraviolet (UV) Coating Formulation: The Permittee shall limit use of UV coating to the formulation described in Appendix B of this permit. For authorization to use other UV coatings with formulations that increase emissions of any chemical identified under the Toxicological or Ecological Information section of the Safety Data Sheet, or that add new chemicals not identified in the Toxicological or Ecological Information section of the Safety Data Sheet, the Permittee shall submit a major amendment following procedures as required under Minn. R. 7007.1500. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 1	7026	The Permittee is prohibited from using any coating that contains any hazardous air pollutant (HAP), including the target HAPs as defined under 40 CFR Section 63.11180. The Permittee shall keep records that describe the HAP content in each coating used based on manufacturing data or coating analysis as prescribed in Appendix B. [Minn. R. 7007.0800, subp. 2(A)]
COMG 1	7027	VOC Coater Installation Requirements: The Permittee shall install and maintain each VOC coater to meet the following requirements: 1) Non-table top coaters shall be fitted with a stainless steel catch pan designed to catch and minimize spills of coating material and any other contaminants associated with the coating process; 2) Table-top coaters shall be placed in a catch pan or other secondary containment vessel designed to catch and minimize spills of coating material and any other contaminants associated with the coating process; and 3) Non-table top coaters shall be enclosed on all sides, including the top. Concrete walls may not be utilized as part of the coater enclosure. [Minn. R. 7007.0800, subp. 2(A) & (B)]
COMG 1	7028	Battery Terminal Post Coaters: Daily Maintenance. At the end of each shift on each operating day, the Permittee shall inspect each VOC, water-based, and UV coater in COMG 1 for coating spills and other materials in coater catch pans, secondary containment, and/or the floor. The Permittee shall clean and dispose of any coating material, hazardous waste, or other hazardous substance discovered in coater catch pans, secondary containment, or the floor in accordance with applicable state and local hazardous waste, solid waste, recycling and reuse regulations, and the material handling recommendations from the manufacturer of the coatings and solvents used. The Permittee shall keep records of coaters cleaned and corrective actions taken to prevent spills. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. ch. 7045]
COMG 1	7029	Coating Transfer: The Permittee shall perform all transfers of VOC solvent and VOC-containing materials, including mixing of coating formulations, inside a coating room meeting the requirements of COMG 5. Transfer of VOC-containing materials via open containers outside the coating room including, but not limited to buckets, beakers, etc., is prohibited. [Minn. R. 7007.0800, subp. 2(A) & (B)]
COMG 1	7030	VOC-Containing Material Storage: The Permittee shall keep lids securely in place on all VOC-containing material storage and transfer containers while not in active use. [Minn. R. 7007.0800, subp. 2(A) & (B)]
COMG 1	7031	The Permittee shall submit a notification: Due 30 calendar days before addition, replacement, or conversion of coaters authorized under COMG 1. The notification shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The notification shall include the planned date for beginning of operations and the following forms: 1) Coaters not required to comply with COMG 5: MPCA forms GI-02, GI-03, GI-04 and GI-05B 2) Coaters required to comply with COMG 5: MPCA forms GI-05B and GI-05A, if control equipment is required under COMG 2, COMG 4 or COMG 8. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subps. 5-6]
COMG 1	21346	The Permittee shall submit an annual report by the 31st of January. The report shall document the 1,2-(trans-) Dichloroethylene VOC 365-day rolling sum calculations for the previous calendar year. The report shall include the results of the 1,2-(trans-) Dichloroethylene VOC Quarterly Purchase Audits required elsewhere in this permit. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The report shall be submitted with the annual Compliance Certification required by this permit. As part of the Annual Report, the Permittee shall verify and certify that the Facility has maintained minor source status for PSD and Part 70. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subp. 2]

SI Id	Sequence	Requirement
COMG 1	21347	The Permittee shall submit a notification due 30 calendar days before replacement of control equipment authorized under COMG 11. The notification shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The notification shall include the planned date for beginning of operations and forms GI-05A. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subps. 5-6]
COMG 1	21348	The Permittee shall submit a notification due 30 calendar days before replacement of control equipment authorized under COMG 12. The notification shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The notification shall include the planned date for beginning of operations and forms GI-05A. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subps. 5-6]
COMG 1	21349	The Permittee shall submit a notification due 30 calendar days before replacement of control equipment authorized under COMG 14. The notification shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The notification shall include the planned date for beginning of operations and forms GI-05A. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subps. 5-6]
COMG 2	3941	The Permittee shall install, operate and maintain each ultraviolet (UV) battery terminal post coater subject to COMG 2 requirements inside a coating room meeting the requirements of COMG 5. This requirement does not apply to EQUI 82, EQUI 117, or EQUI 240. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 2	3942	The Permittee shall vent emissions from each ultraviolet (UV) battery terminal post coater subject to COMG 2 requirements to control equipment meeting the requirements of COMG 14 whenever each ultraviolet (UV) battery terminal post coater operates. This requirement does not apply to EQUI 82, EQUI 117, or EQUI 240. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 2	3943	Each ultraviolet (UV) battery terminal post coater subject to COMG 2 requirements is subject to the requirements in COMG 1 except as noted within COMG 1. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 2	3944	Each ultraviolet (UV) battery terminal post coater operated at the facility is subject to the requirements in COMG 5. This requirement does not apply to EQUI 117 and EQUI 240. [Minn. R. 7007.0800, subp. 2(A) & 2(B), Minn. R. 7007.0800, subps. 4-5, Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 2	3945	The Permittee is prohibited from using any coating that contains any hazardous air pollutant (HAP), including the target HAPs as defined under 40 CFR Section 63.11180. [Minn. R. 7007.0800, subp. 2(A)]
COMG 2	3970	Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total quantity of each coating and other solids-containing material, including the solids content of each coating (as a mass fraction), used by each coater in COMG 2. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 2	3980	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate, record, and maintain a record of the following for the previous operating day using the daily usage records: 1) Total weight of UV coating used by each unit in COMG 2, in pounds/day; and 2) Daily average hourly emissions of PM10 and PM2.5 from all coaters in COMG 2 as determined elsewhere in this permit, in pounds/hour. This record shall also include solids contents of each material as determined by the Material Content requirement of this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
COMG 2	4000	PM < 10 micron: Daily Calculations. The Permittee shall calculate PM10 emissions from COMG 2 using the following equations: PM10UV = [TPM10UV (uncontrolled) + TPM10UV (controlled)] / 24 TPM10UV (uncontrolled) = [(KUV1 x LUV1) + (KUV2 x LUV2) + (KUV3 x LUV3)] TPM10UV (controlled) = [(KUV1 x LUV1) + (KUV2 x LUV2) + (KUV3 x LUV3)] x (1-CE1) where: PM10UV = daily average PM10 emissions from COMG 2, in pounds/hour; TPM10UV = total daily PM10 emissions from each EQUI in COMG 2, in pounds/day; KUV# = total weight of coating used in COMG 2 based on daily usage logs, in pounds/day; and LUV# = uncontrolled PM10 emission factor, in pounds PM10 per pound of coating, listed in Appendix B, as a fraction. Other uncontrolled emission factors allowed by this permit shall be based on the most recent MPCA-approved stack test results performed according to approved replicable methodology (ARM) requirements; and CE1 = minimum PM10 control efficiency required by COMG 14 for the coaters required to be controlled, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
COMG 2	4020	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate PM2.5 emissions from COMG 2 using the following equations: PM2.5UV = TPM2.5UV (uncontrolled) + TPM2.5UV (controlled)] / 24 TPM2.5UV (uncontrolled) = [(KUV1 x PUV1) + (KUV2 x PUV2) + (KUV3 x PUV3)] TPM2.5UV (controlled) = [(KUV1 x PUV1) + (KUV2 x PUV2) + (KUV3 x PUV3)] x (1-CE2) where: PM2.5UV = daily average PM2.5 emissions from COMG 2, in pounds/hour; TPM2.5UV = total daily PM2.5 emissions from each EQUI in COMG 2, in pounds/day; KUV# = total weight of coating used in COMG 2 based on daily usage logs, in pounds/day; and PUV# = uncontrolled PM2.5 emission factor, in pounds PM2.5 per pound of coating, listed in Appendix B, as a fraction. Other uncontrolled emission factors allowed by this permit shall be based on the most recent MPCA-approved stack test results performed according to approved replicable methodology (ARM) requirements; and CE2 = minimum PM2.5 control efficiency required by COMG 14 for the coaters required to be controlled, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
COMG 2	4030	Maximum Contents of Materials and Process Rate: The Permittee assumed certain worst-case contents of materials and process rates when determining the short-term potential to emit of units in COMG 2. These assumptions are listed in Appendix B of this permit. Increasing the process rate or changing to a material that has a higher content of any of the given pollutants, or an addition of a pollutant not listed in Appendix B, is considered a change in method of operation that must be evaluated under Minn. R. 7007.1200, subp. 3 to determine if a permit amendment or notification is required under Minn. R. 7007.1150. [Minn. R. 7005.0100, subp. 35a]
COMG 2	4040	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of coating in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of coating, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
COMG 2	7000	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
COMG 2	7001	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
COMG 2	7002	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of coating in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of coating, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 2	7003	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
COMG 2	7004	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
COMG 4	1	The Permittee shall install, operate and maintain each VOC spray battery terminal post coater subject to COMG 4 requirements inside a coating room meeting the requirements of COMG 5. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 4	2	The Permittee shall vent emissions from each VOC spray battery terminal post coater subject to COMG 4 requirements to control equipment meeting the requirements of COMG 14 whenever each VOC spray battery terminal post coater operates. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 4	3	Each VOC spray battery terminal post coater subject to COMG 4 requirements is subject to the requirements in COMG 1. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 4	4	The Permittee is prohibited from using any coating that contains any hazardous air pollutant (HAP), including the target HAPs as defined under 40 CFR Section 63.11180. [Minn. R. 7007.0800, subp. 2(A)]
COMG 4	3860	Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total quantity of each coating and other solids-containing material, including the solids content of each coating (as a mass fraction), used by each coater in COMG 4. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
COMG 4	3980	Particulate Matter: Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate, record, and maintain a record of the following for the previous operating day using the daily usage records: 1) Total weight of VOC coating used by each unit in COMG 4, in pounds/day; and 2) Daily average hourly emissions of PM10 and PM2.5 from all coaters in COMG 4 as determined elsewhere in this permit, in pounds/hour. This record shall also include solids contents of each material as determined by the Material Content requirement of this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 4	4010	PM < 10 micron: Daily Calculations. The Permittee shall calculate PM10 emissions from COMG 4 using the following equations: PM10VOC = TPM10VOC/24 TPM10VOC = [(IVOC1 x JVOC1) + (IVOC2 x JVOC2) + (IVOC3 x JVOC3)] x (1-TE) x (1-CE1) where: PM10VOC = daily average PM10 emissions from COMG 4, in pounds/hour; TPM10VOC = total daily PM10 emissions from each EQUI in COMG 4, in pounds/day; IVOC# = total weight of coating used in COMG 4 based on daily usage logs, in pounds/day; and JVOC# = solids content of coating used in IVOC#, in weight percent; TE = minimum transfer efficiency allowed by the permit as of permit issuance (65 percent). Other transfer efficiencies allowed by this permit shall be based on the most recent MPCA-approved stack test results according to approved replicable methodology (ARM) requirements; and CE1 = minimum PM10 control efficiency required by COMG 14, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
COMG 4	4020	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate PM2.5 emissions from COMG 4 using the following equations: PM2.5VOC = TPM2.5VOC/24 TPM2.5VOC = [(IVOC1 x JVOC1) + (IVOC2 x JVOC2) + (IVOC3 x JVOC3)] x (1-TE) x (1-CE2) where: PM2.5VOC = daily average PM10 emissions from COMG 4, in pounds/hour; TPM2.5VOC = total daily PM2.5 emissions from each EQUI in COMG 4, in pounds/day; IVOC# = total weight of coating used in COMG 4 based on daily usage logs, in pounds/day; and JVOC# = solids content of coating used in IVOC#, in weight percent; TE = minimum transfer efficiency allowed by the permit as of permit issuance (65 percent). Other transfer efficiencies allowed by this permit shall be based on the most recent MPCA-approved stack test results according to approved replicable methodology (ARM) requirements; and CE2 = minimum PM2.5 control efficiency required by COMG 14, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
COMG 4	4030	Material Content. Solids (PM, PM<10 microns, and PM<2.5 microns) contents in coatings and other materials used in COMG 4 shall be determined by the Safety Data Sheet (SDS) or the Material Safety Data Sheet (MSDS) provided by the supplier for each material used. If a material content range is given on the SDS or the MSDS, the highest number in the range shall be used in all compliance calculations. If there is information provided in the Regulatory Section of the SDS, the highest number in the range of that section may be used. Other alternative methods approved by the MPCA may be used to determine the solids content. The Commissioner reserves the right to require the Permittee to determine the solids content of any material, according to EPA or ASTM reference methods. If an EPA or ASTM reference method is used for material content determination, the data obtained shall supersede the SDS or the MSDS. [Minn. R. 7007.0800, subp. 4-5]

SI Id	Sequence	Requirement
COMG 4	4040	Maximum Contents of Materials and Process Rate: The Permittee assumed certain worst-case contents of materials and process rates when determining the short-term potential to emit of units in COMG 4. These assumptions are listed in Appendix B of this permit. Increasing the process rate or changing to a material that has a higher content of any of the given pollutants, or an addition of a pollutant not listed in Appendix B, is considered a change in method of operation that must be evaluated under Minn. R. 7007.1200, subp. 3 to determine if a permit amendment or notification is required under Minn. R. 7007.1150. [Minn. R. 7005.0100, subp. 35a]
COMG 4	19821	Transfer efficiency for PM < 10 micron: Protocol for Re-Setting the Transfer efficiency Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission rates in pound PM10 per hour and transfer efficiency in pound PM10 per pound of solids (as applied) as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per hour and pound of coating solids as applied in the performance test report required by Minn. R. 7017.2035, subp. 1. The transfer efficiency for PM < 10 micron used for calculating emissions shall be re-set to the 3-hour average transfer efficiency in pound PM10 per pound of coating solids as applied, measured during the most recent MPCA-approved emission factor performance test. The new transfer efficiency for PM < 10 micron: used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subp. 2(A) & (B) , Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 4	19822	Transfer efficiency for PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Transfer efficiency for PM < 10 micron Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
COMG 4	19823	Transfer efficiency for PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
COMG 4	19824	Transfer efficiency for PM < 2.5 micron: Protocol for Re-Setting the Transfer efficiency Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission rates in pound PM2.5 per hour and transfer efficiency in pound PM2.5 per pound of solids (as applied) as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per hour and pound of coating solids as applied in the performance test report required by Minn. R. 7017.2035, subp. 1. The transfer efficiency for PM < 2.5 micron used for calculating emissions shall be re-set to the 3-hour average transfer efficiency in pound PM2.5 per pound of coating solids as applied, measured during the most recent MPCA-approved emission factor performance test. The new transfer efficiency for PM < 2.5 micron: used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 4	19825	Transfer efficiency for PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Transfer efficiency for PM < 2.5 micron Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]

SI Id	Sequence	Requirement
COMG 4	19826	Transfer efficiency for PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
COMG 5	1	The Permittee shall limit Coating Room Pressure Drop <= -0.007 inches of water, as established in Method 204 of appendix M to 40 CFR part 51. Pressure drop across the established enclosure shall be monitored at all times as described elsewhere in this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 5	2	The Permittee shall vent emissions from each EQUI subject to COMG 5 requirements to a stack/vent meeting the requirements of STRU 73 whenever each EQUI in COMG 5 operates. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 5	3	The Permittee shall operate and maintain each individual coating room the North Building as permanent total enclosures that meet the criteria of Method 204 of appendix M, 40 CFR pt. 51. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 5	4	Coating Room Pressure Drop Continuous Monitoring Devices: The Permittee shall install, operate, and maintain a pressure drop monitoring system (pressure drop gauge EQUI 169, EQUI 170 and EQUI 171 and building management system EQUI 168) for each enclosure meeting the following requirements and maintain records of compliance with these requirements: (1) Complete a minimum of one cycle of operation for each successive 15-minute period having a minimum of four equally spaced successive cycles of CPMS operation in one hour; (2) Determine the average of all recorded readings for each successive 3-hour period of the emission capture system and add-on control device operation; (3) Record the results of each inspection, calibration, and validation check of the pressure drop gauge; (4) Maintain the pressure drop gauge at all times and have available necessary parts for routine repairs of the monitoring equipment; (5) Operate the pressure drop gauge and collect pressure drop data at all times that a coating operation is operating, except during monitoring malfunctions, associated repairs, and required quality assurance or control activities (including, if applicable, calibration checks and required zero and span adjustments); (6) Do not use data recorded during monitoring malfunctions, associated repairs, out-of-control periods, or required quality assurance or control activities when calculating data averages. Use all the data collected during all other periods in calculating the data averages for determining compliance with the emission capture system and add-on control device operating limits;
		(7) Locate the pressure drop gauge(s) in or as close to a position that provides a representative measurement of the pressure drop across each monitored enclosure (each coating room); (8) Use a pressure drop gauge with an accuracy of at least five percent of the minimum pressure drop to be maintained. (9) Perform an initial calibration of the pressure drop gauge according to the manufacturer's requirements; (10) Conduct a validation check before initial operation or upon relocation or replacement of a pressure drop gauge. Validation checks include comparison of pressure drop gauge values to calibrated pressure measurement devices or to pressure simulation using calibrated pressure sources; (11) Conduct accuracy audits every quarter and after every deviation. Accuracy audits include comparison of pressure drop gauge values to calibrated pressure measurement devices or to pressure simulation using calibrated pressure sources; (12) Perform monthly leak checks on pressure connections. A pressure of at least 1.0 inches of water column to the connection must yield a stable sensor result for at least 15 seconds; and (13) Perform a visual inspection of the pressure drop gauge at least monthly if there is no redundant pressure drop gauge. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]

SI Id	Sequence	Requirement
COMG 5	5	Coating Room Pressure Alarm: The Permittee shall install, operate, and maintain an alarm that triggers when the pressure drop set point is exceeded. The set point at which the alarm triggers shall be set such that the alarm sounds when the pressure drop limit established in this permit is not met. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 5	6	Coating Room Airflow Direction: The Permittee shall maintain airflow into the Coating Room enclosure at all times. If airflow into the enclosure is not maintained, coating operations in the Coating Room shall be shut down until airflow direction into the enclosure is restored and shall be reported as a deviation. The Permittee shall document and keep records of all deviations, including the date of malfunction, steps taken to restore airflow direction into the enclosure, and the date operation continued. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 5	7	Coating Room Negative Pressure Monitoring: The Permittee shall continuously monitor the pressure drop across the enclosure of each coating room established during the most-recent performance test following Method 204 of appendix M to 40 CFR Part 51. If it is discovered that negative pressure is not being maintained, either by inspection or the alarm is sounded, coating operations in the coating room shall be shut down until a negative pressure state is restored. Each violation of the pressure drop limit shall be reported as a deviation. The Permittee shall document and keep records of all deviations, including the date of malfunction, steps taken to restore the minimum negative pressure, and the date operation continued. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Minn. Stat. 116.385, subd. 3]
COMG 5	8	Weekly Reporting: The Permittee shall submit a weekly report due by 4:30pm on Friday each week that includes pressure drop readings, the door status, and daily alarm verification for each coating room in COMG 5. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The report shall be submitted to AQRoutineReport@pca.state.mn.us and must include any deviation from the approved minimum pressure drop, and/or door status, the actions taken to evaluate the reasons for the deviation, and the corrective actions taken to resolve the deviations. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subp. 2(A) & (B)]
COMG 5	9	The Permittee shall install and maintain a Retro-Coat Vapor Intrusion System on the floor surfaces of each coating room in COMG 5 where t-DCE VOC coaters operate. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. Stat. 116.385, subd. 3]
COMG 5	10	The Permittee shall conduct a performance test due within 30 days of permit issuance and every 12 months thereafter to determine if each coating room in COMG 5 is a permanent total enclosure that meets the criteria of Method 204 of appendix M to 40 CFR pt. 51. The first test is due by the date specified above and all subsequent tests shall be completed every 12 months thereafter by the due date (month and day) and as described below. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Method 204, or other method approved by MPCA in the performance test plan approval. Testing conducted during the 60 days prior to the performance test due date will not reset the test due date for future testing as required by this permit or within a Notice of Compliance letter. Testing conducted more than 60 days prior to the performance test due date satisfies this test due date requirement but will reset future performance test due dates based on the performance test date. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
COMG 5	11	Daily Inspection: On each day of operation, the Permittee shall inspect the floor of each coating room where t-DCE VOC coaters operate to check for degradation of the Retro-Coat Vapor Intrusion Coating System and do the following (where applicable): 1) If degradation is discovered, the Permittee shall immediately resolve the degradation. 2) If the degradation is not resolved within 24 hours, the Permittee shall immediately cease VOC-coating operations in that coating room until the degradation is corrected. 3) Notify the MPCA immediately upon ceasing VOC coating operations due to degradation on the Retro-Coat Vapor Intrusion System. 4) Photographs of all degradation areas shall be taken before and after corrective actions are taken. Photographs shall be retained in Facility records. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. Stat. 116.385, subd. 3]
COMG 5	12	The Permittee shall submit a report due monthly by the 15th of every month. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The report shall be submitted to AQRoutineReport@pca.state.mn.us and must contain the following: 1) Floor degradation discovered in the past month; and 2) Description of all corrective actions. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subp. 2(A) & (B)]
COMG 5	13	Daily Inspection: On each day of operation, the Permittee shall inspect the and record the door status and verify the alarm system is operating with a set point at a minimum pressure drop of 0.007 inches of water for each coating room. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
COMG 6	3570	Filterable Particulate Matter <= 0.40 pounds per million Btu heat input. The potential to emit from the unit is 0.0076 lb/MMBtu due to equipment design and allowable fuels. This limit applies individually to each unit in COMG 6. [Minn. R. 7011.0515, subp. 1]
COMG 6	3580	Opacity <= 20 percent opacity except for one six-minute period per hour of not more than 60 percent opacity. [Minn. R. 7011.0515, subp. 2]
COMG 6	3632	Fuel type: Natural gas only, by design. [Minn. R. 7005.0100, subp. 35a]
COMG 6	3637	The Permittee shall keep records of fuel purchases showing fuel types. for the purpose of reporting emissions to the annual emission inventory. [Minn. R. 7007.0800, subp. 5, Minn. R. 7019.3000-7019.3100]
COMG 7	3680	Particulate Matter <= 0.30 grains per dry standard cubic foot of exhaust gas unless required to further reduce emissions to comply with the less stringent limit of either Minn. R. 7011.0730 or Minn. R. 7011.0735. This limit applies individually to each unit in COMG 7. [Minn. R. 7011.0715, subp. 1(A)]
COMG 7	3690	Opacity <= 20 percent opacity. This limit applies individually to each unit in COMG 7. [Minn. R. 7011.0715, subp. 1(B)]
COMG 8	1	The Permittee shall install, operate and maintain each water-based spray battery terminal post coater subject to COMG 8 requirements inside a coating room meeting the requirements of COMG 5. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 8	2	The Permittee shall vent emissions from each water-based spray battery terminal post coater subject to COMG 8 requirements to control equipment meeting the requirements of COMG 14 whenever each water-based spray battery terminal post coater operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 8	3	Water-based Spray Battery Terminal Post Coater operated at the facility is subject to the requirements in COMG 1. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 8	4	The Permittee is prohibited from using any coating that contains any hazardous air pollutant (HAP), including the target HAPs as defined under 40 CFR Section 63.11180. [Minn. R. 7007.0800, subp. 2(A)]
COMG 8	3180	Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total quantity of each coating and other solids-containing material, including the solids content of each coating (as a mass fraction), used by each coater in COMG 8. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
COMG 8	3190	Particulate Matter: Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate, record, and maintain a record of the following for the previous operating day using the daily usage records: 1) Total weight of water-based coating used by each unit in COMG 8, in pounds/day; and 2) Daily average hourly emissions of PM10 and PM2.5 from all water-based coaters in COMG 8 as determined elsewhere in this permit, in pounds/hour. This record shall also include solids contents of each material as determined by the Material Content requirement of this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 8	3855	PM < 10 micron: Daily Calculations. The Permittee shall calculate PM10 emissions from COMG 8 using the following equations: PM10WB = TPM10WB/24 TPM10WB = [(IWB1 x JWB1) + (IWB2 x JWB2) + (IWB3 x JWB3)] x (1-TE) x (1-CE1) where: PM10WB = daily average PM10 emissions from COMG 8, in pounds/hour; TPM10WB = total daily PM10 emissions from each EQUI in COMG 8, in pounds/day; IWB# = total weight of coating used in COMG 8 based on daily usage logs, in pounds/day; JWB# = solids content of coating used in IWB#, in weight percent; TE = minimum transfer efficiency allowed by the permit as of permit issuance (65 percent). Other transfer efficiencies allowed by this permit shall be based on MPCA-approved stack test results according to approved replicable methodology (ARM) requirements; and CE1 = minimum PM10 control efficiency required by COMG 14, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
COMG 8	3860	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate PM2.5 emissions from COMG 8 using the following equations: PM2.5WB = TPM2.5WB/24 TPM2.5WB = [(IWB1 x JWB1) + (IWB2 x JWB2) + (IWB3 x JWB3)] x (1-TE) x (1-CE2) where: PM2.5WB = daily average PM2.5 emissions from COMG 8, in pounds/hour; TPM2.5WB = total daily PM2.5 emissions from each EQUI in COMG 8, in pounds/day; IWB# = total weight of coating used in COMG 8 based on daily usage logs, in pounds/day; JWB# = solids content of coating used in IWB#, in weight percent; TE = minimum transfer efficiency allowed by the permit as of permit issuance (65 percent). Other transfer efficiencies allowed by this permit shall be based on MPCA-approved stack test results according to approved replicable methodology (ARM) requirements; and CE2 = minimum PM2.5 control efficiency required by COMG 14, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
COMG 8	3980	Material Content. Solids (PM, PM<10 microns, and PM<2.5 microns) contents in coatings and other materials used in COMG 8 shall be determined by the Safety Data Sheet (SDS) or the Material Safety Data Sheet (MSDS) provided by the supplier for each material used. If a material content range is given on the SDS or the MSDS, the highest number in the range shall be used in all compliance calculations. If there is information provided in the Regulatory Section of the SDS, the highest number in the range of that section may be used. Other alternative methods approved by the MPCA may be used to determine the solids content. The Commissioner reserves the right to require the Permittee to determine the solids content of any material, according to EPA or ASTM reference methods. If an EPA or ASTM reference method is used for material content determination, the data obtained shall supersede the SDS or the MSDS. [Minn. R. 7007.0800, subp. 4-5]

SI Id	Sequence	Requirement
COMG 8	4010	Maximum Contents of Materials and Process Rate: The Permittee assumed certain worst-case contents of materials and process rates when determining the short-term potential to emit of units in COMG 8. These assumptions are listed in Appendix B of this permit. Increasing the process rate or changing to a material that has a higher content of any of the given pollutants, or an addition of a pollutant not listed in Appendix B, is considered a change in method of operation that must be evaluated under Minn. R. 7007.1200, subp. 3 to determine if a permit amendment or notification is required under Minn. R. 7007.1150. [Minn. R. 7005.0100, subp. 35a]
COMG 8	19821	Transfer efficiency for PM < 10 micron: Protocol for Re-Setting the Transfer efficiency Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission rates in pound PM10 per hour and transfer efficiency in pound PM10 per pound of solids (as applied) as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per hour and pound of coating solids as applied in the performance test report required by Minn. R. 7017.2035, subp. 1. The transfer efficiency for PM < 10 micron used for calculating emissions shall be re-set to the 3-hour average transfer efficiency in pound PM10 per pound of coating solids as applied, measured during the most recent MPCA-approved emission factor performance test. The new transfer efficiency for PM < 10 micron: used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 8	19822	Transfer efficiency for PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Transfer efficiency for PM < 10 micron Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
COMG 8	19823	Transfer efficiency for PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
COMG 8	19824	Transfer efficiency for PM < 2.5 micron: Protocol for Re-Setting the Transfer efficiency Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission rates in pound PM2.5 per hour and transfer efficiency in pound PM2.5 per pound of solids (as applied) as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per hour and pound of coating solids as applied in the performance test report required by Minn. R. 7017.2035, subp. 1. The transfer efficiency for PM < 2.5 micron used for calculating emissions shall be re-set to the 3-hour average transfer efficiency in pound PM2.5 per pound of coating solids as applied, measured during the most recent MPCA-approved emission factor performance test. The new transfer efficiency for PM < 2.5 micron: used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 8	19825	Transfer efficiency for PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Transfer efficiency for PM < 2.5 micron Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]

SI Id	Sequence	Requirement
COMG 8	19826	Transfer efficiency for PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
COMG 9	1	The Permittee shall vent emissions from EQUI 167 to a stack/vent meeting the requirements of STRU 41 whenever EQUI 167 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 9	5	The Permittee shall operate and maintain a Sub-Slab Depressurization and Solvent Vapor Extraction system (EQUI 167), and vent emissions to two 2,000-pound granulated activated carbon (GAC) canisters connected in-series (TREA 50 and TREA 51) such that all solvent vapor emissions from beneath the facility floor are captured and vented through the remediation stack (STRU 41) following the requirements of this permit. The requirement to vent emissions from EQUI 167 to TREA 50 and 51 terminates when the MPCA Remediation Division approves the removal of TREA 50 and TREA 51 in writing. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
COMG 9	6	Sampling Locations: The Permittee shall install and maintain gas sampling ports at the following locations required by the MPCA Remediation Division. This includes but is not limited to sampling ports at the inlet side, in between and at the effluent side of the two carbon canisters controlling emissions from EQUI 167. The requirement to install and maintain gas sampling ports at these locations terminates when the MPCA Remediation Division approves the removal of TREA 50 and TREA 51 in writing. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
COMG 9	7	The Permittee shall obtain a gas sample from the Solvent Vapor Extraction system at the locations and with the frequency required by the MPCA Remediation Division. If sampling is required, the Permittee shall send each sample to a third-party analytical laboratory for analysis following EPA Method TO-15. The requirement to conduct quarterly sampling of emissions from Solvent Vapor Extraction system terminates when the MPCA Remediation Division approves the removal of TREA 50 and TREA 51 in writing. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
COMG 9	8	Sample Analytical Results Recordkeeping: If sampling and analysis is required by the MPCA Remediation Division, the Permittee shall maintain a record of the analytical test results on each required gas sample, including the date of the test and the concentration of emissions from each VOC species measured by EPA Method TO-15. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]

SI Id	Sequence	Requirement
COMG 9	10	1,2-(trans-) Dichloroethylene: Emissions Calculations: If required by the MPCA, the Permittee shall calculate and record emission rates of 1,2-(trans-) Dichloroethylene and of all the other chemicals analyzed by EPA Method TO-15, in pounds per day, using the following equation: SVR = BTi x Vrem Where: SVR = daily emissions of 1,2-(trans-) Dichloroethylene (or other chemicals analyzed by EPA Method TO-15), in pound/day; BTi = concentration of 1,2-(trans-) Dichloroethylene (or other chemicals analyzed by EPA Method TO-15) measured for the last required sample, in pounds/actual cubic foot; and Vrem = exhaust flow rate from the solvent vapor remediation stack, in standard cubic feet/day. As of permit issuance, the exhaust flow rate at the remediation stack is 695 standard cubic feet per minute (1,000,800 standard cubic feet per day). Other standard exhaust flow rates from the solvent vapor remediation stack allowed by this permit shall be based on MPCA-approved test results according to approved replicable methodology (ARM) requirements. Any subsequent standard exhaust flow rate from the solvent vapor remediation stack must be measured concurrently with the measurement of 1,2-(trans-) Dichloroethylene concentration. Records of the BTi value obtained for any given sample shall be made available as required by MPCA. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
COMG 9	11	The Permittee shall operate and maintain the sub-slab depressurization and solvent vapor extraction system, and carbon canisters in COMG 9 in accordance with the Operation and Maintenance (O & M) Plan approved by the MPCA Remediation Division. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. The requirement to maintain TREA 50 and 51 terminates when the MPCA Remediation Division approves the removal of TREA 50 and TREA 51 in writing. [Minn. R. 7007.0800, subp. 14, Minn. Stat. 116.07, subd. 9(2)]
COMG 9	12	Carbon Canister Replacement: After 300 days of continuous service, or sooner if the manufacturer recommends replacement before 300 days of continuous service, the Permittee shall perform the following procedure: 1) Replace the lead carbon canister (first in-series) with a fresh carbon canister; 2) Move the lag carbon canister (second in-series) to the lead position; and 3) Install the new carbon canister as the lag carbon canister (second in-series). The Permittee shall keep records of the date of each canister change. The requirement for carbon canister replacement terminates when the MPCA Remediation Division approves the removal of TREA 50 and TREA 51 in writing. [Minn. R. 7007.0800, subp. 2(A), Minn. Stat. 116.07, subd. 9(2)]
COMG 9	13	Carbon Canister Removal. The Permittee is authorized to remove carbon canister control equipment (TREA 50 and TREA 51) upon written approval from the MPCA Remediation Division without obtaining a major permit amendment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a) & 9(2)]
COMG 9	14	Routine Inspections: The Permittee shall verify operation of the sub-slab vapor remediation system and visually inspect the condition of each carbon canister in COMG 9 with respect to alignment, saturation, and any other condition that may affect the filter's performance with the frequency required by MPCA Remediation Division. The Permittee shall maintain a daily written record of system and filter inspections. The requirement for routine inspections of carbon canisters terminates when the MPCA Remediation Division approves the removal of TREA 50 and TREA 51 in writing. [Minn. R. 7007.0800, subp. 2(A), Minn. Stat. 116.07, subd. 9(2)]
COMG 9	15	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the Solvent Vapor Extraction system and control equipment components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4-5, Minn. Stat. 116.07, subd. 9(2)]

SI Id	Sequence	Requirement
COMG 9	16	Corrective Actions: If the sub-slab depressurization and solvent vapor extraction system, carbon canister or any of their components in COMG 9 are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan for the sub-slab depressurization and solvent vapor extraction system and carbon canisters. The Permittee shall keep a record of the type and date of any corrective action taken. The requirement for corrective actions on carbon canisters terminates when the MPCA Remediation Division approves the removal of TREA 50 and TREA 51 in writing. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5, Minn. Stat. 116.07, subd. 9(2)]
COMG 9	17	Protocol for Resetting the Standard Exhaust Flow Rate from the Solvent Vapor Remediation Stack: The Permittee may conduct performance testing to measure the standard exhaust flow rate and temperature from the solvent vapor remediation stack as allowed elsewhere in this permit. If the established standard exhaust flow rate from the solvent vapor remediation stack is to be reset, the reset shall be based on the standard exhaust flow rate from the solvent vapor remediation stack values recorded during the most recent MPCA-approved performance test where compliance with applicable emission limits was demonstrated. The established standard exhaust flow rate from the solvent vapor remediation stack shall be reset as follows: - if the highest standard exhaust flow rate recorded during the test are higher than the respective established standard exhaust flow rate, it shall be reset to the highest standard exhaust flow rate resulting from the test; or - if the highest standard exhaust flow rate recorded during the test are lower than the respective established emission factor, it shall be reset to the highest standard exhaust flow rate resulting from the test. The new standard exhaust flow rate shall be effective upon receipt of the Notice of Compliance letter that approves the test results and shall be incorporated into the permit when the permit is next amended. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 9	18	The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting Standard Exhaust Flow Rate allowed by this permit. [Minn. R. 7007.1500, subp. 1]
COMG 9	19	Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the Notice of Compliance letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
COMG 9	20	The Permittee shall operate EQUI 167 meeting the requirements of COMG 1. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 10	1	The Permittee shall limit emissions of PM < 10 micron <= 0.07966 pounds per hour 3-hour average. This is the emission rate used in modeling and it represents uncontrolled emissions at process capacity. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 10	3	The Permittee shall limit emissions of PM < 2.5 micron <= 0.07966 pounds per hour 3-hour average. This is the emission rate used in modeling and it represents uncontrolled emissions at process capacity. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 10	4	The Permittee shall limit emissions of Nitrogen Oxides <= 1.0482 pounds per hour 3-hour average. This is the emission rate used in modeling and it represents uncontrolled emissions at process capacity. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
COMG 10	5	The Permittee shall limit emissions of Lead <= 0.000005 pounds per hour 3-hour average. This is the emission rate used in modeling and it represents uncontrolled emissions at process capacity. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 10	6	The Permittee shall limit total maximum Heat Input <= 10.69 million Btu per hour. This limit applies to the combined heat input of all the space heating units in COMG 10 located in the North Building (STRU 38). If the Permittee replaces any existing direct heating equipment, adds new direct heating equipment, or modifies the existing equipment, such equipment is subject to this permit limit as well as all of the requirements in COMG 10. Prior to making such a change, the Permittee shall apply for and obtain the appropriate permit amendment, as applicable. The Permittee is not required to complete emissions calculations described in Minn. R. 7007.1200, subp. 2. A permit amendment will still be needed regardless of the emissions increase if the change will be subject to a new applicable requirement or requires revisions to the limits or monitoring and recordkeeping in this permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 10	7	The Permittee shall keep an inventory of combustion units operating in the North Building (STRU 38), including manufacturer, model number, maximum-rated heat input capacity, in million British Thermal Units per hour, and location of the combustion unit. These records shall be kept up-to-date and available for inspection. [Minn. R. 7007.0800, subp. 5]
COMG 10	8	The Permittee shall not operate the space heating equipment during the months of June, July and August. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 10	9	Daily Recordkeeping. On each day of operation, the Permittee shall record the space heaters operating in the North Building (STRU 38). [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 11	1	The Permittee shall operate and maintain in-series control equipment train such that it achieves an overall control efficiency for Particulate Matter >= 97.0 percent control efficiency. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 11	2	The Permittee shall operate and maintain in-series control equipment train such that it achieves an overall control efficiency for PM < 10 micron >= 97.0 percent control efficiency. [Minn. R. 7007.0080, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 11	3	The Permittee shall operate and maintain in-series control equipment train such that it achieves an overall control efficiency for PM < 2.5 micron >= 97.0 percent control efficiency. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 11	4	The Permittee shall operate and maintain in-series control equipment train such that it achieves an overall control efficiency for Lead >= 86.0 percent control efficiency. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 11	5	The Permittee shall vent emissions from EQUIs 101, 102, 103, 104, and 221 to an in-series control equipment train meeting the permit requirements under COMG 11. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
COMG 11	6	If the Permittee replaces any control equipment unit subject to the requirements in COMG 11, the replacement in-series control equipment train must meet or exceed the control efficiency requirements for COMG 11 as well as comply with all other requirements of COMG 11. Prior to making such a change, the Permittee shall apply for and obtain the appropriate permit amendment, as applicable. If no amendment is needed for the replacement, the Permittee shall submit an electronic notice to the Agency using Form CR-05. The notice must be received by the Agency seven working days prior to the commencement/start of replacement. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 11	7	The Permittee shall operate and maintain each control equipment train in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
COMG 11	8	Daily Inspections: Once each operating day, the Permittee shall visually inspect the condition of each control equipment train with respect to any other condition that may affect the control equipment train's performance. The Permittee shall maintain a daily written record of these inspections. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, sub. 4a(a)]
COMG 11	9	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the control equipment train components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4 & 5]
COMG 11	10	Corrective Actions: If the control equipment train or any of their components are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan. The Permittee shall keep a record of the type and date of any corrective action taken. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4 & 5]
COMG 11	11	Daily Monitoring: The Permittee shall physically verify the operation of the Continuous Parameter Monitoring System (CPMS) for each Smog Hog in COMG 11 at least once each operating day to verify that it is working and recording properly. The Permittee shall maintain a written record of the daily. [Minn. R. 7007.0800, subps. 4-5]
COMG 11	12	Data Collection: The Permittee shall maintain a continuous hard copy readout or computer disk file that shows the On/Off condition of each Smog Hog at all times. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020 0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 11	13	Quarterly Inspections: At least once per calendar quarter, or more frequently if required by the manufacturer of the smog hogs, the Permittee shall inspect the control equipment components that are subject to wear or plugging, for example: bearings, belts, hoses, fans, nozzles, orifices, and ducts. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4-5]
COMG 11	14	Monitoring Equipment: The Permittee must install and maintain a continuous parameter monitoring system (CPMS) for monitoring the Smog Hog On/Off condition as required by this permit. The monitoring equipment must be installed, in use, and properly maintained, including maintaining the necessary parts for routine repairs of the monitoring equipment, whenever operation of the monitored control equipment is required. [Minn. R. 7007.0800, subps. 4-5]
COMG 11	15	Annual Inspections: At least once per calendar year, or more frequently if required by the manufacturer, the Permittee shall inspect the Smog Hog components not covered by the quarterly inspections. This includes, but is not limited to, components that are not subject to wear or plugging including structural components, housings, and hoods. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
COMG 11	16	Pre-Filter and Cell Maintenance for Smog Hogs: The Permittee shall transport pre-filters and cells in leak-proof containers during cleaning, replacement, or performing other maintenance. The Permittee shall dispose of all lead-soiled materials including, but not limited to, dishwasher wastewater, mop heads, rags, personal protective equipment (PPE), vacuum bags, and any other material soiled or otherwise in contact with lead as hazardous waste. [Minn. R. 7007.0800, subp. 2, Minn. R. ch. 7045]
COMG 11	17	Corrective Actions for smog hogs: The Permittee shall take corrective action as soon as possible if any of the following occur: - any recorded operating parameter is outside the required operating range; or - the Smog Hog or any of its components are found during the inspections to need repair. Corrective actions shall return operation to within the permitted range and/or include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O&M Plan for the Smog Hog. The Permittee shall keep a record of the type and date of any corrective action taken for the Smog Hog. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4-5]
COMG 12	1	The Permittee shall operate and maintain in-series control equipment train such that it achieves an overall control efficiency for Particulate Matter >= 86.6 percent control efficiency. [Minn. R. 7007.0800, subp. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 12	2	The Permittee shall operate and maintain in-series control equipment train such that it achieves an overall control efficiency for PM < 10 micron >= 86.6 percent control efficiency. [Minn. R. 7007.0800, subp. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 12	3	The Permittee shall operate and maintain in-series control equipment train such that it achieves an overall control efficiency for PM < 2.5 micron >= 86.6 percent control efficiency. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 12	4	The Permittee shall vent emissions from EQUIs 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 146, 147, 149, 150, 152, 153, 154, 155, 156, 157, and 158 to an in-series control equipment train meeting the permit requirements under COMG 12. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 12	5	If the Permittee replaces any control equipment unit subject to the requirements of COMG 12, the replacement in-series control equipment train must meet or exceed the control efficiency requirements for COMG 12 as well as comply with all other requirements of COMG 12. Prior to making such a change, the Permittee shall apply for and obtain the appropriate permit amendment, as applicable. If no amendment is needed for the replacement, the Permittee shall submit an electronic notice to the Agency using Form CR-05. The notice must be received by the Agency seven working days prior to the commencement/start of replacement. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 12	6	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the control equipment train components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4 & 5]
COMG 12	7	The Permittee shall operate and maintain each control equipment train in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
COMG 12	8	Daily Inspections: Once each operating day, the Permittee shall visually inspect the condition of each control equipment train with respect to any other condition that may affect the control equipment train's performance. The Permittee shall maintain a daily written record of these inspections. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
COMG 12	9	Corrective Actions: If the control equipment train or any of their components are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan. The Permittee shall keep a record of the type and date of any corrective action taken. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4 & 5]
COMG 12	11	Daily Monitoring: The Permittee shall physically verify the operation of the Continuous Parameter Monitoring System (CPMS) for each Smog Hog in COMG 11 at least once each operating day to verify that it is working and recording properly. The Permittee shall maintain a written record of the daily. [Minn. R. 7007.0800, subps. 4-5]
COMG 12	12	Data Collection: The Permittee shall maintain a continuous hard copy readout or computer disk file that shows the On/Off condition of each Smog Hog at all times. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020 0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 12	13	Quarterly Inspections: At least once per calendar quarter, or more frequently if required by the manufacturer of the smog hogs, the Permittee shall inspect the control equipment components that are subject to wear or plugging, for example: bearings, belts, hoses, fans, nozzles, orifices, and ducts. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4-5]
COMG 12	14	Monitoring Equipment: The Permittee must install and maintain a continuous parameter monitoring system (CPMS) for monitoring the Smog Hog On/Off condition as required by this permit. The monitoring equipment must be installed, in use, and properly maintained, including maintaining the necessary parts for routine repairs of the monitoring equipment, whenever operation of the monitored control equipment is required. [Minn. R. 7007.0800, subps. 4-5]
COMG 12	15	Annual Inspections: At least once per calendar year, or more frequently if required by the manufacturer, the Permittee shall inspect the Smog Hog components not covered by the quarterly inspections. This includes, but is not limited to, components that are not subject to wear or plugging including structural components, housings, and hoods. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4-5]
COMG 12	16	Pre-Filter and Cell Maintenance for Smog Hogs: The Permittee shall transport pre-filters and cells in leak-proof containers during cleaning, replacement, or performing other maintenance. The Permittee shall dispose of all lead-soiled materials including, but not limited to, dishwasher wastewater, mop heads, rags, personal protective equipment (PPE), vacuum bags, and any other material soiled or otherwise in contact with lead as hazardous waste. [Minn. R. 7007.0800, subp. 2, Minn. R. ch. 7045]
COMG 12	17	Corrective Actions for smog hogs: The Permittee shall take corrective action as soon as possible if any of the following occur: - any recorded operating parameter is outside the required operating range; or - the Smog Hog or any of its components are found during the inspections to need repair. Corrective actions shall return operation to within the permitted range and/or include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O&M Plan for the Smog Hog. The Permittee shall keep a record of the type and date of any corrective action taken for the Smog Hog. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subps. 4-5]
COMG 13	3450	The Permittee shall limit Particulate Matter <= 0.30 grains per dry standard cubic foot of exhaust gas unless required to further reduce emissions to comply with the less stringent limit of either Minn. R. 7011.0730 or Minn. R. 7011.0735. This limit applies to each individual unit in COMG 13. [Minn. R. 7011.0610, subp. 1(A)(1)]
COMG 13	3460	The Permittee shall limit Opacity <= 20 percent opacity except for one six-minute period per hour of not more than 60 percent opacity. This limit applies to each individual unit in COMG 13. [Minn. R. 7011.0610, subp. 1(A)(2)]
COMG 13	3512	Fuel type: Natural gas only, by design. [Minn. R. 7005.0100, subp. 35a]
COMG 13	3517	The Permittee shall keep records of fuel purchases showing fuel types. [Minn. R. 7007.0800, subp. 5]

SI Id	Sequence	Requirement
COMG 14	1	The Permittee shall operate and maintain each piece of control equipment in this group such that it achieves a control efficiency for Particulate Matter >= 99.0 percent control efficiency. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 14	2	The Permittee shall operate and maintain each piece of control equipment in this group such that it achieves a control efficiency for PM < 10 micron >= 99.0 percent control efficiency. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 14	3	The Permittee shall operate and maintain each piece of control equipment in this group such that it achieves a control efficiency for PM < 2.5 micron >= 99.0 percent control efficiency. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 14	4	The Permittee shall operate and maintain the HEPA filter in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
COMG 14	5	If the Permittee replaces any HEPA filter subject to COMG 14 requirements, the replacement control must meet or exceed the control efficiency requirements of COMG 14 as well as comply with all other requirements of COMG 14. Prior to making such a change, the Permittee shall apply for and obtain the appropriate permit amendment, as applicable. If no amendment is needed for the replacement, the Permittee shall submit an electronic notice to the Agency using Form CR-05. The notice must be received by the Agency seven working days prior to the commencement/start of replacement. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 14	6	Daily Inspections: Once each operating day, the Permittee shall visually inspect the condition of each HEPA filter with respect to alignment, saturation, tears, holes and any other condition that may affect the filter's performance. The Permittee shall maintain a daily written record of filter inspections. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 14	7	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the control equipment components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
COMG 14	8	Corrective Actions: If the filters or any of their components are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan for the filter. The Permittee shall keep a record of the type and date of any corrective action taken for each filter. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
COMG 15	1	The Permittee shall limit emissions of PM < 10 micron <= 0.0171 pounds per hour 3-hour average. This is the emission rate used in modeling and it represents uncontrolled emissions at process capacity. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 15	3	The Permittee shall limit emissions of PM < 2.5 micron <= 0.0171 pounds per hour 3-hour average. This is the emission rate used in modeling and it represents uncontrolled emissions at process capacity. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 15	4	The Permittee shall limit emissions of Nitrogen Oxides <= 0.2248 pounds per hour 3-hour average. This is the emission rate used in modeling and it represents uncontrolled emissions at process capacity. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 15	5	The Permittee shall limit emissions of Lead <= 0.000001 pounds per hour 3-hour average. This is the emission rate used in modeling and it represents uncontrolled emissions at process capacity. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]

Commented [A75]: See comment above at TREA 55-59. The COMG 14 HEPA filters will be Nederman units. The manufacturer does not recommend opening the units on a daily or quarterly basis; instead the pressure gauges shall be checked once each operating day to determine when the filters require maintenance.

Commented [A76]: Same comment as above.

SI Id	Sequence	Requirement
COMG 15	6	The Permittee shall limit total maximum Heat Input <= 2.29 million Btu per hour. This limit applies to the combined heat input of all space heating units in COMG 15 located in the South Building (STRU 42). If the Permittee replaces any existing direct heating equipment, adds new direct heating equipment, or modifies the existing equipment, such equipment is subject to this permit limit as well as all of the requirements in COMG 15. Prior to making such a change, the Permittee shall apply for and obtain the appropriate permit amendment, as applicable. The Permittee is not required to complete emissions calculations described in Minn. R. 7007.1200, subp. 2. A permit amendment will still be needed regardless of the emissions increase if the change will be subject to a new applicable requirement or requires revisions to the limits or monitoring and recordkeeping in this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 15	7	The Permittee shall keep an inventory of combustion units in the South Building (STRU 42), including manufacturer, model number, maximum-rated heat input capacity, in million British Thermal Units per hour, and location of the combustion unit. The Permittee shall update the list to include any replaced, modified, or new equipment prior to making the change. The list shall correlate the units to the Subject Item numbers used in this permit and shall include the data on GI-04, GI-05B, GI-05C, and GI-05F. The date of construction shall be the date the change was made for replaced, modified, or new equipment. The list shall correlate the units to the Subject Item numbers used in this permit and shall include the data on GI-04, GI-05B, GI-05C, and GI-05F. The date of construction shall be the date the change was made for replaced, modified, or new equipment. [Minn. R. 7007.0800, subp. 2(A)]
COMG 15	8	The Permittee shall not operate the space heating equipment during the months of June, July and August. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 15	9	Daily Recordkeeping. On each day of operation, the Permittee shall record the space heaters operating in the South Building (STRU 42). [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
COMG 16	1	The Permittee shall limit Process Throughput <= 39,355.50 tons per year 365-day rolling sum. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 16	2	The Permittee shall limit captured and controlled emissions of Lead <= 48.21 pounds per year 365-day rolling sum to be calculated each operating day for the previous 365-day period as described later in this permit. This limit applies to captured and controlled lead emissions from all EQUIs in COMG 16. The captured and controlled emissions from each EQUI in COMG 16 are the stack lead emissions calculated at each corresponding EQUI stack by using the controlled lead emission factor listed in Appendix D. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 16	3	The Permittee shall limit uncaptured emissions of Lead <= 8.46 pounds per year 365-day rolling sum to be calculated each operating day for the previous 365-day period as described later in this permit. This limit applies to uncaptured lead emissions from all EQUIs in COMG 16. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 16	4	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by all EQUIs in COMG 16. This shall be based on written usage logs; and 2) total process throughput from all EQUIs in COMG 16 for the previous 365-day period by calculating the total process throughput for the previous 365 days. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
COMG 16	5	Lead: Captured and Controlled Emissions: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) total captured and controlled lead emissions from all EQUIs in COMG 16 for the previous operating day. The captured and controlled emissions for each EQUI in COMG 16 must be calculated using formulas specified in this permit; and 2) 365-day rolling sum annual captured and controlled lead emissions emitted through each STRU to which from each EQUI in COMG 16 vents for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 16	6	Lead: Uncaptured Emissions: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) total uncaptured lead emissions from all EQUIs in COMG 16 for the previous operating day. The uncontrolled emissions for each EQUI in COMG 16 must be calculated using formulas specified in this permit, and 2) 365-day rolling sum annual uncaptured lead emissions emitted through each STRU to which from each EQUI in COMG 16 vents for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
COMG 16	7	Captured and Controlled Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from COMG 16 using the following equations: COMG16CL = STRU15L365S + STRU16L365S + STRU17L365S + STRU74L365S + STRU20L365S + STRU75L365S + STRU23L365S + STRU24L365S + STRU25L365S + STRU26L365S + STRU30L365S + STRU31L365S + STRU32L365S + STRU33L365S = STRU34L365S + STRU35L365S where: COMG16CL = 365-day rolling sum captured and controlled lead emissions emitted from all EQUIs in COMG 16 for the previous 365-day period, in pounds/year; and STRU#L365S = 365-day rolling sum captured and controlled lead emissions emitted through the STRU# to which each EQUI in COMG 16 vents for the previous 365-day period, in pounds/year. [Minn. R. 7007.0800, subps. 4-5]
COMG 16	8	Uncaptured Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual uncaptured lead emissions from COMG 16 using the following equations: COMG16UL = STRU43L365S + STRU44L365S + STRU45L365S + STRU46L365S + STRU47L365S + STRU48L365S + STRU49L365S + STRU50L365S + STRU51L365S + STRU52L365S + STRU53L365S + STRU56L365S where: COMG16UL = 365-day rolling sum uncaptured lead emissions emitted from all EQUIs in COMG 16 for the previous 365-day period, in pounds/year; and STRU#L365S = 365-day rolling sum uncaptured lead emissions emitted through the STRU# to which each EQUI in COMG 16 vents for the previous 365-day period, in pounds/year. [Minn. R. 7007.0800, subps. 4-5]
EQUI 82	4060	At the time of permit issuance, EQUI 82 is a UV spray coater as described in Appendix B of this permit and shall comply with the requirements under COMG 1 and COMG 5. EQUI 82 shall comply with the requirements under COMG 2 except for the condition to operate with control equipment meeting the requirements in COMG 14. EQUI 82 may be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subp. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 84	2	At the time of permit issuance, EQUI 84 is a UV spray coater as described in Appendix B of this permit and shall comply with the requirements under COMG 1, COMG 2, and COMG 5. EQUI 84 may be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000]

SI Id	Sequence	Requirement
EQUI 84	3	The Permittee shall vent emissions from EQUI 84 to control equipment meeting the requirements of TREA 55 whenever EQUI 84 operates. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 85	2	At the time of permit issuance, EQUI 85 is a water-based drip coater as described in Appendix B of this permit and it exhausts emissions through STRU 73. EQUI 85 shall comply with the requirements under COMG 1 and COMG 5. Compliance with COMG 5 is required for as long as EQUI 85 exhausts emissions through STRU 73. EQUI 85 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 87	2	At the time of permit issuance, EQUI 87 is a VOC dip coater as described in Appendix B of this permit and shall comply with the requirements under COMG 1 and COMG 5. EQUI 87 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000]
EQUI 88	2	At the time of permit issuance, EQUI 88 is a VOC or water-based drip/spray coater as described in Appendix B of this permit and shall comply with requirements under COMG 1, COMG 4 when operating with VOC coatings. EQUI 88 shall comply with requirements under COMG 1, COMG 5, and COMG 8 when operating with water-based coating. EQUI 88 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 88	3	The Permittee shall vent emissions from EQUI 88 to control equipment meeting the requirements of TREA 56 whenever EQUI 88 operates. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 89	2	At the time of permit issuance, EQUI 89 is a water-based dip coater as described in Appendix B of this permit and it exhausts emissions through STRU 73. EQUI 89 shall comply with requirements under COMG 1 and COMG 5. Compliance with COMG 5 is required for as long as EQUI 89 exhausts emissions through STRU 73. EQUI 89 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 92	2	At the time of permit issuance, EQUI 92 is a water-based dip coater as described in Appendix B of this permit and it exhausts emissions through STRU 73. EQUI 92 shall comply with requirements under COMG 1 and COMG 5. Compliance with COMG 5 is required for as long as EQUI 92 exhausts emissions through STRU 73. EQUI 92 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000]
EQUI 93	2	At the time of permit issuance, EQUI 93 is a VOC or water-based dip coater as described in Appendix B of this permit and shall comply with requirements under COMG 1 and COMG 5. EQUI 93 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 94	2	At the time of permit issuance, EQUI 94 is a VOC or water-based drip coater as described in Appendix B of this permit and shall comply with requirements under COMG 1 and COMG 5. EQUI 94 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R, 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
EQUI 95	2	At the time of permit issuance, EQUI 95 is a VOC or water-based spray coater as described in Appendix B of this permit. EQUI 95 shall comply with requirements under COMG 1, COMG 4 and COMG 5 when operating with VOC coating. EQUI 95 shall comply with requirements under COMG 1, COMG 5, and COMG 8 when operating with water-based coating. EQUI 95 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 95	3	The Permittee shall vent emissions from EQUI 95 to control equipment meeting the requirements of TREA 57 whenever EQUI 95 operates. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 97	2	At the time of permit issuance, EQUI 97 is a water-based dip coater as described in Appendix B of this permit and it exhausts emissions through STRU 73. EQUI 97 shall comply with requirements under COMG 1 and COMG 5. Compliance with COMG 5 is required for as long as EQUI 97 exhausts emissions through STRU 73. EQUI 97 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 98	2	At the time of permit issuance, EQUI 98 is a VOC or water-based drip coater as described in Appendix B of this permit and shall comply with requirements under COMG 1 and COMG 5. EQUI 98 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 99	2	At the time of permit issuance, EQUI 99 is a VOC or water-based dip coater as described in Appendix B of this permit and shall comply with requirements under COMG 1 and COMG 5. EQUI 99 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 100	2	At the time of permit issuance, EQUI 100 is a VOC or water-based drip coater as described in Appendix B of this permit and shall comply with requirements under COMG 1 and COMG 5. EQUI 100 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 101	3170	The Permittee must limit Process Throughput <= 2180.0 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 101	3180	Process Throughput: Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total weight of each lead-containing material processed by EQUI 101. This shall be based on written usage logs. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 101	3190	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 101 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 101	3455	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 101 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 101	3460	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equation: EQUI101PM10 = [A x B x (1-CE1)] / 24 Where: EQUI101PM10 = daily average PM10 emissions from EQUI 101, in pounds/hour; A = total weight of lead-containing material processed by EQUI 101 for the previous operating day, in pounds/day; and B = uncontrolled PM10 emission factor for EQUI 101 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 101	3465	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equation: EQUI101PM2.5 = [A x C x (1-CE2)] / 24 Where: EQUI101PM2.5 = daily average PM2.5 emissions from EQUI 101, in pounds/hour; A = total weight of lead-containing material processed by EQUI 101 for the previous operating day, in pounds/day; and C = uncontrolled PM2.5 emission factor for EQUI 101 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 101	3470	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equation: EQUI101L = D x E x (1 – CE3) Where: EQUI101L = total lead emissions from EQUI 101, in pounds/day; D = total weight of lead-containing material processed by EQUI 101 for the previous operating day, in pounds/day; and E = uncontrolled lead emission factor for EQUI 101 listed in Appendix D, as a fraction; and CE3 = minimum overall lead control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4 5]
EQUI 101	3475	The Permittee shall vent melt emissions from EQUI 101 to control equipment meeting the requirements of TREA 1 and TREA 60 operated in-series, and COMG 11 whenever EQUI 101 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 101	3632	Fuel type: Natural gas only, by design. [Minn. R. 7005.0100, subp. 35a]
EQUI 101	6450	The Permittee shall vent melt emissions from EQUI 101 to a stack/vent meeting the requirements of STRU 1 whenever EQUI 101 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 101	19650	The Permittee shall vent combustion emissions from EQUI 101 to a stack/vent meeting the requirements of STRU 68 whenever EQUI 101 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 101	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 101	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 101	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 101	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 101	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 101	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

SI Id	Sequence	Requirement
EQUI 103	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equation: EQUI103PM10 = [A x B x (1-CE1)] / 24 Where: EQUI103PM10 = daily average PM10 emissions from EQUI 103, in pounds/hour; A = total weight of lead-containing material processed by EQUI 103 for the previous operating day, in pounds/day; and B = uncontrolled PM10 emission factor for EQUI 103 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 103	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equation: EQUI103PM2.5 = [A x C x (1-CE2)] / 24 Where: EQUI103PM2.5 = daily average PM2.5 emissions from EQUI 103, in pounds/hour; A = total weight of lead-containing material processed by EQUI 103 for the previous operating day, in pounds/day; and C = uncontrolled PM2.5 emission factor for EQUI 103 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 103	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equation: EQUI103L = D x E x (1 – CE3) Where: EQUI103L = total lead emissions from EQUI 103, in pounds/day; D = total weight of lead-containing material processed by EQUI 103 for the previous operating day, in pounds/day; and E = uncontrolled lead emission factor for EQUI 103 listed in Appendix D, as a fraction; and CE3 = minimum overall lead control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4 5]
EQUI 103	3632	Fuel type: Natural gas only, by design. [Minn. R. 7005.0100, subp. 35a]
EQUI 103	6430	The Permittee shall vent melt emissions from EQUI 103 to control equipment meeting the requirements of TREA 1 and TREA 60 operated in-series, and COMG 11 whenever EQUI 103 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 103	6450	The Permittee shall vent melt emissions from EQUI 103 to a stack/vent meeting the requirements of STRU 1 whenever EQUI 103 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 103	19650	The Permittee shall vent combustion emissions from EQUI 103 to a stack/vent meeting the requirements of STRU 69 whenever EQUI 103 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 103	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 103	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 103	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 103	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 103	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 103	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

SI Id	Sequence	Requirement
EQUI 103	19666	Lead: Protocol for Re-Setting the Emission Factor Used For Calculating Lead Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 12 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 103	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 103	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 103	19669	The Permittee shall not operate EQUI 102 and EQUI 103 simultaneously. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 104	3455	The Permittee must limit Process Throughput <= 4000.0 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 104	3460	Process Throughput: Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total weight of each lead-containing material processed by EQUI 104. This shall be based on written usage logs. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 104	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 104 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 104	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 104 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 104	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equation: EQUI104PM10 = [A x B x (1-CE1)] / 24 Where: EQUI104PM10 = daily average PM10 emissions from EQUI 104, in pounds/hour; A = total weight of lead-containing material processed by EQUI 104 for the previous operating day, in pounds/day; and B = uncontrolled PM10 emission factor for EQUI 104 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 104	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equation: EQUI104PM2.5 = [A x C x (1-CE2)] / 24 Where: EQUI104PM2.5 = daily average PM2.5 emissions from EQUI 104, in pounds/hour; A = total weight of lead-containing material processed by EQUI 104 for the previous operating day, in pounds/day; and C = uncontrolled PM2.5 emission factor for EQUI 104 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 104	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equation: EQUI104L = D x E x (1 – CE3) Where: EQUI104L = total lead emissions from EQUI 104, in pounds/day; D = total weight of lead-containing material processed by EQUI 104 for the previous operating day, in pounds/day; and E = uncontrolled lead emission factor for EQUI 104 listed in Appendix D, as a fraction; and CE3 = minimum overall lead control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4 5]
EQUI 104	3632	Fuel type: Natural gas only, by design. [Minn. R. 7005.0100, subp. 35a]
EQUI 104	6430	The Permittee shall vent melt emissions from EQUI 104 to control equipment meeting the requirements of TREA 1 and TREA 60 operated in-series, and COMG 11 whenever EQUI 104 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 104	6450	The Permittee shall vent melt emissions from EQUI 104 to a stack/vent meeting the requirements of STRU 1 whenever EQUI 104 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 104	19650	The Permittee shall vent combustion emissions from EQUI 104 to a stack/vent meeting the requirements of STRU 68 whenever EQUI 104 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 104	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

EQUI 114	2	The Permittee shall vent emissions from EQUI 114 to a stack/vent meeting the requirements of STRU 57 whenever EQUI 114 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 115	1	The Permittee is prohibited from increasing emissions of pollutants from EQUI 115 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. The Permittee shall vent emissions from EQUI 115 control equipment meeting the permit requirements of TREA 54. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 115	2	The Permittee shall vent emissions from EQUI 115 to a stack/vent meeting the requirements of STRUs 43 and 50 whenever EQUI 115 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 116	1	The Permittee shall vent emissions from EQUI 116 to a stack/vent meeting the requirements of STRU 50 whenever EQUI 116 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 116	2	At the time of permit issuance, EQUI 116 is a water-based dip coater as described in Appendix B of this permit and shall comply with requirements under COMG 1. EQUI 116 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 116	3	The Permittee shall apply water-based coating from EQUI 116 using dip or drip application methods only unless it is modified as authorized elsewhere in this permit. Spray application of coating while venting emissions to STRU 50 is prohibited. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 117	1	The Permittee shall vent emissions from EQUI 117 to a stack/vent meeting the requirements of STRU 35 whenever EQUI 117 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 117	2	At the time of permit issuance, EQUI 117 is a UV spray coater as described in Appendix B of this permit and shall comply with requirements under COMG 1. EQUI 117 shall comply with the requirements under COMG 2 except for having to comply with operating under the following conditions: 1) operate with control equipment meeting the requirements in COMG 14; and 2) operate in a coating room meeting the requirements of COMG 5. EQUI 117 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & (B) , Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 117	3	The Permittee is prohibited from using any coating that contains any hazardous air pollutant (HAP), including the target HAPs as defined under 40 CFR Section 63.11180. [Minn. R. 7007.0800, subps. 2(A)]
EQUI 117	4	Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total quantity of each coating and other solids-containing material, including the solids content of each coating (as a mass fraction), used by EQUI 117 and the time of the day when EQUI 117 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 117	3465	Particulate Matter: Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate, record, and maintain a record of the following for the previous operating day using the daily usage records: 1) Total weight of UV coating used by EQUI 117, in pounds/day; and 2) Daily average hourly emissions of PM10 and PM2.5 from EQUI 117 as determined elsewhere in this permit, in pounds/hour. This record shall also include solids contents of each material as determined by the Material Content requirement of this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 117	3475	PM < 10 micron: The Permittee shall calculate PM10 emissions from EQUI 117 using the following equations: EQUI117PM10 = F x G where: EQUI117PM10 = daily average PM10 emissions from EQUI 117, in pounds/hour; F = total weight of coating used in EQUI 117 based on daily usage logs, in pounds/day; and G = uncontrolled PM10 emission factor, in pounds PM10 per pound of coating, listed in Appendix B, as a fraction. Other uncontrolled emission factors allowed by this permit shall be based on the most recent MPCA-approved stack test results performed according to approved replicable methodology (ARM) requirements. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 117	3480	PM < 2.5 micron: PM < 2.5 micron: Daily Calculations. The Permittee shall calculate PM2.5 emissions from EQUI 117 using the following equations: EQUI117PM2.5 = F x H where: EQUI117PM2.5 = daily average PM2.5 emissions from EQUI 117, in pounds/hour; F = total weight of coating used in EQUI 117 based on daily usage logs, in pounds/day; and G = uncontrolled PM2.5 emission factor, in pounds PM2.5 per pound of coating, listed in Appendix B, as a fraction. Other uncontrolled emission factors allowed by this permit shall be based on the most recent MPCA-approved stack test results performed according to approved replicable methodology (ARM) requirements. [Minn. R. 7007.0800, subps. 4-5]
EQUI 117	3481	Maximum Contents of Materials and Process Rate: The Permittee assumed certain worst-case contents of materials and process rates when determining the short term potential to emit of EQUI 117. These assumptions are listed in Appendix B of this permit. Increasing the process rate or changing to a material that has a higher content of any of the given pollutants, or an addition of a pollutant not listed in Appendix B, is considered a change in method of operation that must be evaluated under Minn. R. 7007.1200, subp. 3 to determine if a permit amendment or notification is required under Minn. R. 7007.1150. [Minn. R. 7005.0100, subps. 35a]
EQUI 117	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 117	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 117	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

SI Id	Sequence	Requirement
EQUI 117	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 117	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 117	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 117	19666	The Permittee must limit the daily operation of EQUI 117 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 120	3475	The Permittee shall vent emissions from EQUI 120 to a stack/vent meeting the requirements of STRU 4 whenever EQUI 120 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 120	3520	The Permittee must limit emissions of NMHC+NOx <= 4.7 grams per kilowatt-hour. [40 CFR 60.4202(a)(2), 40 CFR 60.4205(b), 40 CFR 63.6590(c), Minn. R. 7011.2305]
EQUI 120	3535	The Permittee must limit emissions of Particulate Matter <= 0.40 grams per kilowatt-hour. [40 CFR 60.4202(a)(2), 40 CFR 60.4205(b), 40 CFR 63.6590(c), Minn. R. 7011.2305]
EQUI 120	3540	The Permittee must limit emissions of Carbon Monoxide <= 5.0 grams per kilowatt-hour. [40 CFR 60.4202(a)(2), 40 CFR 60.4205(b), Minn. R. 7011.2305]
EQUI 120	3550	The Permittee must limit emissions of Opacity <= 20 percent opacity during the acceleration mode. [40 CFR 60.4202(a)(2), 40 CFR 60.4205(b), 40 CFR 63.6590(c), Minn. R. 7011.2305]
EQUI 120	3560	The Permittee must limit emissions of Opacity <= 15 percent opacity during the lugging mode. [40 CFR 60.4202(a)(2), 40 CFR 60.4205(b), 40 CFR 63.6590(c), Minn. R. 7011.2305]
EQUI 120	3565	The Permittee must limit emissions of Opacity <= 50 percent opacity during the peaks in either the acceleration or lugging modes. [40 CFR 60.4202(a)(2), 40 CFR 60.4205(b), 40 CFR 63.6590(c), Minn. R. 7011.2305]
EQUI 120	3670	The Permittee must limit Sulfur Content of Fuel <= 15.0 parts per million and either a minimum cetane index of 40 or a maximum aromatic content of 35 percent by volume, as required by 40 CFR Section 80.510(b). [40 CFR 60.4207(b), 40 CFR 63.6590(c), Minn. R. 7011.2305]
EQUI 120	4550	Sulfur Dioxide <= 0.0015 pounds per million Btu heat input. The potential to emit from the unit is 0.00044 lb/MMBtu due to equipment design and allowable fuels. [Minn. R. 7011.2300, subp. 2(B)]
EQUI 120	4560	Opacity <= 20 percent opacity once operating temperatures have been attained. [Minn. R. 7011.2300, subp. 1]
EQUI 120	4561	The Permittee shall limit Non-Emergency Operating Hours <= 100 hours per year. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 120	4562	On each day of operation, the Permittee shall operate EQUI 120 between the hours of 1:00pm and 4:00pm for maintenance testing. [Minn. R. 7007.0800, subp. 2(A)]
EQUI 120	4580	The Permittee shall keep records of fuel type and usage on a monthly basis. [Minn. R. 7007.0800, subp. 5]

SI Id	Sequence	Requirement
EQUI 120	4590	Hours of Operation: The Permittee shall maintain documentation on site that the unit is an emergency generator by design that qualifies under the U.S. EPA memorandum entitled "Calculating Potential to Emit (PTE) for Emergency Generators" dated September 6, 1995, limiting operation to 500 hours per year. [Minn. R. 7007.0800, subps. 4-5]
EQUI 120	4600	Fuel type: No. 2 fuel oil/diesel fuel meeting the requirements of 40 CFR Section 1090.305 only by design. [40 CFR 60.4207(b), Minn. R. 7005.0100, subp. 35a]
EQUI 120	19505	Fuel Supplier Certification: The Permittee shall obtain and maintain a fuel supplier certification for each shipment of diesel fuel oil, certifying that the sulfur content does not exceed 0.0015 percent by weight. [Minn. R. 7007.0800, subps. 4-5]
EQUI 120	19530	The Permittee shall submit a notification of date construction began: Due 30 calendar days after Date of Construction Start (or reconstruction). The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). Submit the name and number of the Subject Item and the date construction began. The notification shall be submitted electronically on Form CS-02. [40 CFR 60.7(a)(1), Minn. R. 7007.0500, subp. 3, Minn. R. 7019.0100, subp. 1]
EQUI 120	28030	The Permittee shall submit a notification of the actual date of initial startup: Due 15 calendar days after Initial Startup Date. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The notification shall be submitted electronically on Form CS-02. [40 CFR 60.7(a)(3), Minn. R. 7007.0500, subp. 3, Minn. R. 7019.0100, subp. 1]
EQUI 120	28040	The Permittee shall submit a notification of anticipated date for conducting opacity observations: Due 30 calendar days before Opacity Observation Date. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). [40 CFR 60.7(a)(6), Minn. R. 7007.0500, subp. 3, Minn. R. 7019.0100, subp. 1]
EQUI 120	28050	The Permittee shall submit notification of the date construction of replacement began: Due 60 calendar days before Date of Construction or Replacement (or as soon as practicable). The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). Submit the information specified in 40 CFR Section 60.15(d)(1) through (7). The notification shall be submitted electronically on Form CS-02. [40 CFR 60.15(d), Minn. R. 7007.0500, subp. 3, Minn. R. 7011.0050]
EQUI 120	28060	The Permittee must comply with all applicable requirements of 40 CFR pt. 60, subp. IIII as follows: 40 CFR 60.4200(a)(2)(i); 40 CFR 60.4200(c); 40 CFR 60.4202(a)(2); 40 CFR 60.4205(b); 40 CFR 60.4207(b); 40 CFR 60.4208(a); 40 CFR 60.4209(a); 40 CFR 60.4211(a); 40 CFR 60.4211(c); 40 CFR 60.4211(f); 40 CFR 60.4214(b); 40 CFR 60.4218; 40 CFR 60.4219; and 40 CFR pt. 60, subp. IIII, Table 8. A copy of 40 CFR pt. 60, subp. IIII is included in Appendix J. If the standard changes or upon adoption of a new or amended federal applicable requirement, and if there are more than 3 years remaining in the permit term, the Permittee shall file an application for an amendment within nine months of promulgation of the applicable requirement, pursuant to Minn. R. 7007.0400, subp. 3. [40 CFR pt. 60, subp. IIII, Minn. R. 7007.0400, subp. 3, Minn. R. 7007.1150-7007.1500, Minn. R. 7011.2305]

SI Id	Sequence	Requirement
EQUI 120	28080	The Permittee must comply with all applicable requirements of 40 CFR pt. 60, subp. A as follows: 40 CFR 60.1(a); 40 CFR 60.1(b); 40 CFR 60.1(c); 40 CFR 60.2; 40 CFR 60.3; 40 CFR 60.4; 40 CFR 60.5(a); 40 CFR 60.5(b); 40 CFR 60.6(a); 40 CFR 60.6(b); 40 CFR 60.7(a)(1); 40 CFR 60.7(a)(3); 40 CFR 60.7(a)(4); 40 CFR 60.7(a)(5); 40 CFR 60.7(a)(6); 40 CFR 60.7(a)(7); 40 CFR 60.7(b); 40 CFR 60.7(c); 40 CFR 60.7(d); 40 CFR 60.8(a); 40 CFR 60.8(b); 40 CFR 60.8(c); 40 CFR 60.8(d); 40 CFR 60.8(e); 40 CFR 60.8(f); 40 CFR 60.8(g); 40 CFR 60.8(h); 40 CFR 60.8(i); 40 CFR 60.9; 40 CFR 60.11(a); 40 CFR 60.11(b); 40 CFR 60.11(c); 40 CFR 60.11(d); 40 CFR 60.11(e)(1); 40 CFR 60.11(e)(2); 40 CFR 60.11(e)(3); 40 CFR 60.11(e)(4); 40 CFR 60.11(e)(5); 40 CFR 60.11(e)(6); 40 CFR 60.11(e)(7); 40 CFR 60.11(e)(8); 40 CFR 60.11(f); 40 CFR 60.11(g); 40 CFR 60.12; 40 CFR 60.13(a); 40 CFR 60.13(b); 40 CFR 60.13(c); 40 CFR 60.13(d)(1); 40 CFR 60.13(d)(2); 40 CFR 60.13(e)(1); 40 CFR 60.13(e)(2); 40 CFR 60.13(f); 40 CFR 60.13(g); 40 CFR 60.13(h)(1); 40 CFR 60.13(h)(2); 40 CFR 60.13(h)(3); 40 CFR 60.13(i)(1); 40 CFR 60.13(i)(2); 40 CFR 60.13(i)(3); 40 CFR 60.13(i)(4); 40 CFR 60.13(i)(5); 40 CFR 60.13(i)(6); 40 CFR 60.13(i)(7); 40 CFR 60.13(i)(8); 40 CFR 60.13(i)(9); 40 CFR 60.13(j)(1); 40 CFR 60.13(j)(2); 40 CFR 60.14(a); 40 CFR 60.14(b); 40 CFR 60.14(c); 40 CFR 60.14(e); 40 CFR 60.14(f); 40 CFR 60.14(g); 40 CFR 60.14(h); 40 CFR 60.14(i); 40 CFR 60.14(j); 40 CFR 60.14(k); 40 CFR 60.14(l); 40 CFR 60.15(a); 40 CFR 60.15(b); 40 CFR 60.15(c); 40 CFR 60.15(d); 40 CFR 60.15(e); 40 CFR 60.15(f); 40 CFR 60.15(g); 40 CFR 60.17; 40 CFR 60.18(b)-(f); 40 CFR 60.18(g)-(i); 40 CFR 60.19(a); 40 CFR 60.19(b); 40 CFR 60.19(c); 40 CFR 60.19(d); 40 CFR 60.19(e); 40 CFR 60.19(f)(1); 40 CFR 60.19(f)(2); 40 CFR 60.19(f)(3); and 40 CFR 60.19(f)(4). A copy of 40 CFR pt. 60, subp. A is included in Appendix K. If the standard changes or upon adoption of a new or amended federal applicable requirement, and if there are more than 3 years remaining in the permit term, the Permittee shall file an application for an amendment within nine months of promulgation of the applicable requirement, pursuant to Minn. R. 7007.0400, subp. 3. [40 CFR pt. 60, subp. A, Minn. R. 7007.0400, subp. 3, Minn. R. 7007.1150-7007.1500, Minn. R. 7011.0050, Minn. R. 7017.1010 & 7017.2025, Minn. R. 7019.0100]
EQUI 120	28090	EQUI 120 is a new affected source as defined under 40 CFR pt. 63, subp. ZZZZ, and the facility is an area source as defined at 40 CFR Section 63.2. The Permittee shall meet the requirements of 40 CFR pt. 63, subp. ZZZZ by meeting the requirements of 40 CFR pt. 60, subp. IIII. No further requirements of 40 CFR pt. 63, subp. ZZZZ apply to EQUI 120. [40 CFR 63.6590(c), Minn. R. 7011.8150]
EQUI 121	3170	The Permittee must limit Process Throughput <= 290.53 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 121	3180	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 121, this shall be based on written usage logs; and 2) daily average of the hourly process throughput for EQUI 121 for the previous operating day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 121	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 121 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 121	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 121 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 121	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI121PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI121FPM10 = (A x B x 0.05) / 24 Where: EQUI121PM10 = daily average PM10 stack emissions from EQUI 121, in pounds/hour; EQUI121FPM10 = daily average uncaptured PM10 emissions from EQUI 121, in pounds/hour; A = total weight of lead-containing material processed by EQUI 121 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 121 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 121	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI121PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI121FPM2.5 = (A x C x 0.05) / 24 Where: EQUI121PM2.5 = daily average PM2.5 stack emissions from EQUI 121, in pounds/hour; EQUI121FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 121, in pounds/hour; A = total weight of lead-containing material processed by EQUI 121 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 121 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 121	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI121L = D x E EQUI121FL = D x H x 0.05 Where: EQUI121L = total lead stack emissions from EQUI 121, in pounds/day; EQUI121FL = total uncaptured lead emissions from EQUI 121, in pounds/day; D = total weight of lead-containing material processed by EQUI 121 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 121 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 121 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 121	6430	The Permittee shall vent captured emissions from EQUI 121 to control equipment meeting the requirements of TREA 25 and TREA 61 operated in-series, and COMG 12 whenever EQUI 121 operates. The emissions from EQUI 121 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 121	6450	The Permittee shall vent captured emissions from EQUI 121 to a stack/vent meeting the requirements of STRU 15 whenever EQUI 121 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 121	19650	The Permittee shall vent uncaptured emissions from EQUI 121 to a stack/vent meeting the requirements of STRU 48 whenever EQUI 121 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

EQUI 121	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 121	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 121	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 121	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

EQUI 123	19666	Lead: Protocol for Re-Setting the Emission Factor Used For Calculating Lead Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 12 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 123	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 123	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 124	3455	The Permittee must limit Process Throughput <= 500.01 pounds per day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 124	3460	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 124, this shall be based on written usage logs; and 2) daily average of the hourly process throughput for EQUI 124 for the previous operating day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 124	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 124 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 124	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 124 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 124	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI124PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI124FPM10 = (A x B x 0.05) / 24 Where: EQUI124PM10 = daily average PM10 stack emissions from EQUI 124, in pounds/hour; EQUI124FPM10 = daily average uncaptured PM10 emissions from EQUI 124, in pounds/hour; A = total weight of lead-containing material processed by EQUI 124 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 124 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 124	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI124PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI124FPM2.5 = (A x C x 0.05) / 24 Where: EQUI124PM2.5 = daily average PM2.5 stack emissions from EQUI 124, in pounds/hour; EQUI124FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 124, in pounds/hour; A = total weight of lead-containing material processed by EQUI 124 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 124 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 124	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI124L = D x E EQUI124FL = D x H x 0.05 Where: EQUI124L = total lead stack emissions from EQUI 124, in pounds/day; EQUI124FL = total uncaptured lead emissions from EQUI 124, in pounds/day; D = total weight of lead-containing material processed by EQUI 124 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 124 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 124 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 124	6430	The Permittee shall vent captured emissions from EQUI 124 to control equipment meeting the requirements of TREA 26 and TREA 63 operated in-series, and COMG 12 whenever EQUI 124 operates. The emissions from EQUI 124 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 124	6450	The Permittee shall vent captured emissions from EQUI 124 to a stack/vent meeting the requirements of STRU 16 whenever EQUI 124 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 124	19650	The Permittee shall vent uncaptured emissions from EQUI 124 to a stack/vent meeting the requirements of STRU 43 whenever EQUI 124 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 124	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 124	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 124	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 124	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 124	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 124	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

SI Id	Sequence	Requirement
EQUI 126	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI126PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI126FPM10 = (A x B x 0.05) / 24 Where: EQUI126PM10 = daily average PM10 stack emissions from EQUI 126, in pounds/hour; EQUI126FPM10 = daily average uncaptured PM10 emissions from EQUI 126, in pounds/hour; A = total weight of lead-containing material processed by EQUI 126 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 126 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 126	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI126PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI126FPM2.5 = (A x C x 0.05) / 24 Where: EQUI126PM2.5 = daily average PM2.5 stack emissions from EQUI 126, in pounds/hour; EQUI126FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 126, in pounds/hour; A = total weight of lead-containing material processed by EQUI 126 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 126 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 126	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI126L = D x E EQUI126FL = D x H x 0.05 Where: EQUI126L = total lead stack emissions from EQUI 126, in pounds/day; EQUI126FL = total uncaptured lead emissions from EQUI 126, in pounds/day; D = total weight of lead-containing material processed by EQUI 126 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 126 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 126 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 126	6430	The Permittee shall vent captured emissions from EQUI 126 to control equipment meeting the requirements of TREA 26 and TREA 62 operated in-series, and COMG 12 whenever EQUI 126 operates. The emissions from EQUI 126 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 126	6450	The Permittee shall vent captured emissions from EQUI 126 to a stack/vent meeting the requirements of STRU 16 whenever EQUI 126 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 126	19650	The Permittee shall vent uncaptured emissions from EQUI 126 to a stack/vent meeting the requirements of STRU 50 whenever EQUI 126 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 126	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 126	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 126	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 126	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 126	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 126	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

EQUI 128	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 128	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 128	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 128	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 128	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 128	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. SI Id	Sequence	Requirement
EQUI 130	19666	Lead: Protocol for Re-Setting the Emission Factor Used For Calculating Lead Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 12 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 130	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 130	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 131	3455	The Permittee must limit Process Throughput <= 634.27 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 131	3460	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 131, this shall be based on written usage logs; and 2) daily average of the hourly process throughput for EQUI 131 for the previous operating day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 131	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 131 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 131	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 131 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 131	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI131PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI131FPM10 = (A x B x 0.05) / 24 Where: EQUI131PM10 = daily average PM10 stack emissions from EQUI 131, in pounds/hour; EQUI131FPM10 = daily average uncaptured PM10 emissions from EQUI 131, in pounds/hour; A = total weight of lead-containing material processed by EQUI 131 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 131 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 131	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI131PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI131FPM2.5 = (A x C x 0.05) / 24 Where: EQUI131PM2.5 = daily average PM2.5 stack emissions from EQUI 131, in pounds/hour; EQUI131FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 131, in pounds/hour; A = total weight of lead-containing material processed by EQUI 131 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 131 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 131	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI131L = D x E EQUI131FL = D x H x 0.05 Where: EQUI131L = total lead stack emissions from EQUI 131, in pounds/day; EQUI131FL = total uncaptured lead emissions from EQUI 131, in pounds/day; D = total weight of lead-containing material processed by EQUI 131 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 131 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 131 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 131	6430	The Permittee shall vent captured emissions from EQUI 131 to control equipment meeting the requirements of TREA 78 and TREA 65 operated in-series, and COMG 12 whenever EQUI 131 operates. The emissions from EQUI 131 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 131	6450	The Permittee shall vent captured emissions from EQUI 131 to a stack/vent meeting the requirements of STRU 74 whenever EQUI 131 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 131	19650	The Permittee shall vent uncaptured emissions from EQUI 131 to a stack/vent meeting the requirements of STRU 44 whenever EQUI 131 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 131	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 131	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 131	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 131	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 131	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 131	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

EQUI 133	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI133PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI133FPM10 = (A x B x 0.05) / 24 Where: EQUI133PM10 = daily average PM10 stack emissions from EQUI 133, in pounds/hour; EQUI133FPM10 = daily average uncaptured PM10 emissions from EQUI 133, in pounds/hour; A = total weight of lead-containing material processed by EQUI 133 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 133 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 133	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI133PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI133FPM2.5 = (A x C x 0.05) / 24 Where: EQUI133PM2.5 = daily average PM2.5 stack emissions from EQUI 133, in pounds/hour; EQUI133FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 133, in pounds/hour; A = total weight of lead-containing material processed by EQUI 133 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 133 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 133	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI133L = D x E EQUI133FL = D x H x 0.05 Where: EQUI133L = total lead stack emissions from EQUI 133, in pounds/day; EQUI133FL = total uncaptured lead emissions from EQUI 133, in pounds/day; D = total weight of lead-containing material processed by EQUI 133 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 133 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 133 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 133	6430	The Permittee shall vent captured emissions from EQUI 133 to control equipment meeting the requirements of TREA 30 and TREA 66 operated in-series, and COMG 12 whenever EQUI 133 operates. The emissions from EQUI 133 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 133	6450	The Permittee shall vent captured emissions from EQUI 133 to a stack/vent meeting the requirements of STRU 20 whenever EQUI 133 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 133	19650	The Permittee shall vent uncaptured emissions from EQUI 133 to a stack/vent meeting the requirements of STRU 44 whenever EQUI 133 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 133	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 133	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 133	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 133	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 133	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 133	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

SI Id	Sequence	Requirement
EQUI 133	19666	Lead: Protocol for Re-Setting the Emission Factor Used For Calculating Lead Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 12 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 133	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 133	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 134	3455	The Permittee must limit Process Throughput <= 452.85 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 134	3460	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 134, this shall be based on written usage logs; and 2) daily average of the hourly process throughput for EQUI 134 for the previous operating day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 134	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 134 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 134	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 134 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 134	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI134PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI134FPM10 = (A x B x 0.05) / 24 Where: EQUI134PM10 = daily average PM10 stack emissions from EQUI 134, in pounds/hour; EQUI134FPM10 = daily average uncaptured PM10 emissions from EQUI 134, in pounds/hour; A = total weight of lead-containing material processed by EQUI 134 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 134 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 134	3480	PM < 2.5 micron: Daily Calculation. EQUI 135	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 135	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 135	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 135	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 137	19666	Lead: Protocol for Re-Setting the Emission Factor Used For Calculating Lead Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 12 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 137	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 137	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 138	3455	The Permittee must limit Process Throughput <= 555.28 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 138	3460	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 138, this shall be based on written usage logs; and 2) daily average of the hourly process throughput for EQUI 138 for the previous operating day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 138	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 138 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 138	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 138 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 138	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI138PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI138FPM10 = (A x B x 0.05) / 24 Where: EQUI138PM10 = daily average PM10 stack emissions from EQUI 138, in pounds/hour; EQUI138FPM10 = daily average uncaptured PM10 emissions from EQUI 138, in pounds/hour; A = total weight of lead-containing material processed by EQUI 138 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 138 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 138	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI138PM2.5 = [A x C x 0.95 x (1 – CE1)] / 24 EQUI138FPM2.5 = (A x C x 0.05) / 24 Where: EQUI138PM2.5 = daily average PM2.5 stack emissions from EQUI 138, in pounds/hour; EQUI138FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 138, in pounds/hour; A = total weight of lead-containing material processed by EQUI 138 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 138 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 138	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI138L = D x E EQUI138FL = D x H x 0.05 Where: EQUI138L = total lead stack emissions from EQUI 138, in pounds/day; EQUI138FL = total uncaptured lead emissions from EQUI 138, in pounds/day; D = total weight of lead-containing material processed by EQUI 138 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 138 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 138 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 138	6430	The Permittee shall vent captured emissions from EQUI 138 to control equipment meeting the requirements of TREA 34 and TREA 69 operated in-series, and COMG 12 whenever EQUI 138 operates. The emissions from EQUI 138 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 138	6450	The Permittee shall vent captured emissions from EQUI 138 to a stack/vent meeting the requirements of STRU 24 whenever EQUI 138 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 138	19650	The Permittee shall vent uncaptured emissions from EQUI 138 to a stack/vent meeting the requirements of STRU 45 whenever EQUI 138 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 138	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 138	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 138	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 138	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 138	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 138	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

EQUI 140	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI140PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI140FPM10 = (A x B x 0.05) / 24 Where: EQUI140PM10 = daily average PM10 stack emissions from EQUI 140, in pounds/hour; EQUI140FPM10 = daily average uncaptured PM10 emissions from EQUI 140, in pounds/hour; A = total weight of lead-containing material processed by EQUI 140 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 140 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 140	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI140PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI140FPM2.5 = (A x C x 0.05) / 24 Where: EQUI140PM2.5 = daily average PM2.5 stack emissions from EQUI 140, in pounds/hour; EQUI140FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 140, in pounds/hour; A = total weight of lead-containing material processed by EQUI 140 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 140 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 140	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI140L = D x E EQUI140FL = D x H x 0.05 Where: EQUI140L = total lead stack emissions from EQUI 140, in pounds/day; EQUI140FL = total uncaptured lead emissions from EQUI 140, in pounds/day; D = total weight of lead-containing material processed by EQUI 140 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 140 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 140 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 140	6430	The Permittee shall vent captured emissions from EQUI 140 to control equipment meeting the requirements of TREA 35 and TREA 70 operated in-series, and COMG 12 whenever EQUI 140 operates. The emissions from EQUI 140 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 140	6450	The Permittee shall vent captured emissions from EQUI 140 to a stack/vent meeting the requirements of STRU 25 whenever EQUI 140 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 140	19650	The Permittee shall vent uncaptured emissions from EQUI 140 to a stack/vent meeting the requirements of STRU 45 whenever EQUI 140 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 140	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 140	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 140	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 140	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 140	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 140	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

EQUI 146	19666	Lead: Protocol for Re-Setting the Emission Factor Used For Calculating Lead Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 12 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 146	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 146	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 147	3455	The Permittee must limit Process Throughput <= 1199.66 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 147	3460	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 147, this shall be based on written usage logs; and 2) daily average of the hourly process throughput for EQUI 147 for the previous operating day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 147	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 147 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 147	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 147 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 147	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI147PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI147FPM10 = (A x B x 0.05) / 24 Where: EQUI147PM10 = daily average PM10 stack emissions from EQUI 147, in pounds/hour; EQUI147FPM10 = daily average uncaptured PM10 emissions from EQUI 147, in pounds/hour; A = total weight of lead-containing material processed by EQUI 147 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 147 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 147	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI147PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI147FPM2.5 = (A x C x 0.05) / 24 Where: EQUI147PM2.5 = daily average PM2.5 stack emissions from EQUI 147, in pounds/hour; EQUI147FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 147, in pounds/hour; A = total weight of lead-containing material processed by EQUI 147 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 147 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 147	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI147L = D x E EQUI147FL = D x H x 0.05 Where: EQUI147L = total lead stack emissions from EQUI 147, in pounds/day; EQUI147FL = total uncaptured lead emissions from EQUI 147, in pounds/day; D = total weight of lead-containing material processed by EQUI 147 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 147 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 147 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 147	6430	The Permittee shall vent captured emissions from EQUI 147 to control equipment meeting the requirements of TREA 40 and TREA 74 operated in-series, and COMG 12 whenever EQUI 147 operates. The emissions from EQUI 147 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 147	6450	The Permittee shall vent captured emissions from EQUI 147 to a stack/vent meeting the requirements of STRU 31 whenever EQUI 147 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 147	19650	The Permittee shall vent uncaptured emissions from EQUI 147 to a stack/vent meeting the requirements of STRU 52 whenever EQUI 147 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 147	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 147	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 147	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 147	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 147	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 147	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

SI Id	Sequence	Requirement
EQUI 150	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI150PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI150FPM10 = (A x B x 0.05) / 24 Where: EQUI150PM10 = daily average PM10 stack emissions from EQUI 150, in pounds/hour; EQUI150FPM10 = daily average uncaptured PM10 emissions from EQUI 150, in pounds/hour; A = total weight of lead-containing material processed by EQUI 150 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 150 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 150	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI150PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI150FPM2.5 = (A x G x 0.05) / 24 Where: EQUI150PM2.5 = daily average PM2.5 stack emissions from EQUI 150, in pounds/hour; EQUI150FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 150, in pounds/hour; A = total weight of lead-containing material processed by EQUI 150 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 150 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 150	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI150L = D x E EQUI150FL = D x H x 0.05 Where: EQUI150L = total lead stack emissions from EQUI 150, in pounds/day; EQUI150FL = total uncaptured lead emissions from EQUI 150, in pounds/day; D = total weight of lead-containing material processed by EQUI 150 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 150 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 150 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 150	6430	The Permittee shall vent captured emissions from EQUI 150 to control equipment meeting the requirements of TREA 41 and TREA 75 operated in-series, and COMG 12 whenever EQUI 150 operates. The emissions from EQUI 150 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 150	6450	The Permittee shall vent captured emissions from EQUI 150 to a stack/vent meeting the requirements of STRU 32 whenever EQUI 150 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 150	19650	The Permittee shall vent uncaptured emissions from EQUI 150 to a stack/vent meeting the requirements of STRU 53 whenever EQUI 150 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 150	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 150	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 150	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 150	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 150	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 150	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

SI Id	Sequence	Requirement
EQUI 150	19666	Lead: Protocol for Re-Setting the Emission Factor Used For Calculating Lead Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 12 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 150	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 150	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 152	3455	The Permittee must limit Process Throughput <= 1305.27 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 152	3460	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 152, this shall be based on written usage logs; and 2) daily average of the hourly process throughput for EQUI 152 for the previous operating day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 152	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 152 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 152	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 152 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 152	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI152PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI152FPM10 = (A x B x 0.05) / 24 Where: EQUI152PM10 = daily average PM10 stack emissions from EQUI 152, in pounds/hour; EQUI152FPM10 = daily average uncaptured PM10 emissions from EQUI 152, in pounds/hour; A = total weight of lead-containing material processed by EQUI 152 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 152 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 152	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI152PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI152FPM2.5 = (A x C x 0.05) / 24 Where: EQUI152PM2.5 = daily average PM2.5 stack emissions from EQUI 152, in pounds/hour; EQUI152FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 152, in pounds/hour; A = total weight of lead-containing material processed by EQUI 152 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 152 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 152	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI152L = D x E EQUI152FL = D x H x 0.05 Where: EQUI152L = total daily lead stack emissions, in pounds/day; EQUI152FL = total daily uncaptured lead emissions, in pounds/day; D = total weight of lead-containing material processed by EQUI 152 for the previous operating day, in tons/day; E = controlled lead emission factor for EQUI 152 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 152 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 152	6430	The Permittee shall vent captured emissions from EQUI 152 to control equipment meeting the requirements of TREA 42 and TREA 76 operated in-series, and COMG 12 whenever EQUI 152 operates. SI Id	Sequence	Requirement
EQUI 153	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 153	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 153	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 153	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 153	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 153	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 155	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 155	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 156	3455	The Permittee must limit Process Throughput <= 855.22 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 156	3460	Process Throughput: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 156, this shall be based on written usage logs; and 2) daily average of the hourly process throughput for EQUI 156 for the previous operating day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 156	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 156 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 156	3470	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 156 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 156	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI156PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI156FPM10 = (A x B x 0.05) / 24 Where: EQUI156PM10 = daily average PM10 stack emissions from EQUI 156, in pounds/hour; EQUI156FPM10 = daily average uncaptured PM10 emissions from EQUI 156, in pounds/hour; A = total weight of lead-containing material processed by EQUI 156 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 156 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 156	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI156PM2.5 = [A x C x 0.95 x (1 – CE1)] / 24 EQUI156FPM2.5 = (A x C x 0.05) / 24 Where: EQUI156PM2.5 = daily average PM2.5 stack emissions from EQUI 156, in pounds/hour; EQUI156FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 156, in pounds/hour; A = total weight of lead-containing material processed by EQUI 156 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 156 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 156	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI156L = D x E EQUI156FL = D x H x 0.05 Where: EQUI156L = total lead stack emissions from EQUI 156, in pounds/day; EQUI156FL = total uncaptured lead emissions from EQUI 156, in pounds/day; D = total weight of lead-containing material processed by EQUI 156 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 156 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 156 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 156	6430	The Permittee shall vent captured emissions from EQUI 156 to control equipment meeting the requirements of TREA 42 and TREA 76 operated in-series, and COMG 12 whenever EQUI 156 operates. The emissions from EQUI 156 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. SI Id	Sequence	Requirement
EQUI 158	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equations: EQUI158PM10 = [A x B x 0.95 x (1 – CE1)] / 24 EQUI158FPM10 = (A x B x 0.05) / 24 Where: EQUI158PM10 = daily average PM10 stack emissions from EQUI 158, in pounds/hour; EQUI158FPM10 = daily average uncaptured PM10 emissions from EQUI 158, in pounds/hour; A = total weight of lead-containing material processed by EQUI 158 for the previous operating day, in pounds/day; B = uncontrolled PM10 emission factor for EQUI 158 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 158	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equations: EQUI158PM2.5 = [A x C x 0.95 x (1 – CE2)] / 24 EQUI158FPM2.5 = (A x C x 0.05) / 24 Where: EQUI158PM2.5 = daily average PM2.5 stack emissions from EQUI 158, in pounds/hour; EQUI158FPM2.5 = daily average uncaptured PM2.5 emissions from EQUI 158, in pounds/hour; A = total weight of lead-containing material processed by EQUI 158 for the previous operating day, in pounds/day; C = uncontrolled PM2.5 emission factor for EQUI 158 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 12, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 158	3485	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equations: EQUI158L = D x E EQUI158FL = D x H x 0.05 Where: EQUI158L = total lead stack emissions from EQUI 158, in pounds/day; EQUI158FL = total uncaptured lead emissions from EQUI 158, in pounds/day; D = total weight of lead-containing material processed by EQUI 158 for the previous operating day, in pounds/day; E = controlled lead emission factor for EQUI 158 listed in Appendix D, as a fraction; and H = uncontrolled lead emission factor for EQUI 158 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 158	6430	The Permittee shall vent captured emissions from EQUI 158 to control equipment meeting the requirements of TREA 39 and TREA 73 operated in-series, and COMG 12 whenever EQUI 158 operates. The emissions from EQUI 158 shall be captured with a closed connection to control equipment. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 158	6450	The Permittee shall vent captured emissions from EQUI 158 to a stack/vent meeting the requirements of STRU 30 whenever EQUI 158 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 158	19650	The Permittee shall vent uncaptured emissions from EQUI 158 to a stack/vent meeting the requirements of STRU 52 whenever EQUI 158 operates. The uncaptured emissions shall be limited to emissions escaping the die cast casing. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 158	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 158	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 158	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 158	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 158	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 158	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]

SI Id	Sequence	Requirement
EQUI 158	19666	Lead: Protocol for Re-Setting the Emission Factor Used For Calculating Lead Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 12 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound lead per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound lead per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 158	19667	Lead: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating Lead Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 158	19668	Lead: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 160	3455	The Permittee must limit Process Throughput <= 1000.0 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 160	3460	The Permittee shall limit Process Throughput <= 24.0 pounds per hour 365-day rolling sum. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 160	3465	Process Throughput and Hours of Operation: Daily Recordkeeping. By 4:30 pm on each day of operation, the Permittee shall measure or calculate, record, and maintain a record of the following for the previous operating day: 1) the total weight of each lead-containing material processed by EQUI 160, this shall be based on written usage logs; 2) daily average of the hourly process throughput for EQUI 160 for the previous operating day; 3) average of the hourly process throughput for EQUI 160 for the previous 365-day period by calculating the average of the daily hourly process throughput for the previous 365 days; and 4) the time of the day when the EQUI 160 was operating. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 160	3470	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 160 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 160	3475	Lead: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of each lead-containing material processed by EQUI 160 in the previous operating day using the daily usage records; and 2) The total lead emissions for the previous operating day using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 160	3480	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equation: EQUI160PM10 = (A x B) / 24 Where: EQUI160PM10 = daily average PM10 stack emissions from EQUI 160, in pounds/hour; A = total weight of lead-containing material or pure tin processed by EQUI 160 for the previous operating day, in pounds/day; and B = uncontrolled PM10 emission factor for EQUI 160 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 160	3485	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equation: EQUI160PM2.5 = (A x C) / 24 Where: EQUI160PM2.5 = daily average PM2.5 stack emissions from EQUI 160, in pounds/hour; A = total weight of lead-containing material or pure tin processed by EQUI 160 for the previous operating day, in pounds/day; and C = uncontrolled PM2.5 emission factor for EQUI 160 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 160	6450	Lead: Daily Calculation. The Permittee shall calculate lead emissions using the following equation: EQUI160L = D x E Where: EQUI160L = total lead stack emissions from EQUI 160, in pounds/day; D = total weight of lead-containing material processed by EQUI 160 for the previous operating day, in pounds/day; and E = uncontrolled lead emission factor for EQUI 160 listed in Appendix D, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 160	19660	The Permittee shall vent emissions from EQUI 160 to a stack/vent meeting the requirements of STRU 35 whenever EQUI 160 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 160	19661	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 160	19670	The Permittee must limit the daily operation of EQUI 160 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 166	1	The Permittee shall operate EQUI 166 in a permanent total enclosure meeting the requirements of COMG 5. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 166	2	The Permittee shall operate EQUI 166 meeting the requirements of COMG 1. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 172	1	The Permittee shall vent emissions from EQUI 172 to a stack/vent meeting the requirements of STRU 53 whenever EQUI 172 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 172	2	At the time of permit issuance, EQUI 172 is a water-based dip coater as described in Appendix B of this permit and shall comply with requirements under COMG 1. EQUI 172 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 172	3	The Permittee shall apply water-based coating from EQUI 172 using dip or drip application methods only unless it is modified as authorized elsewhere in this permit. Spray application of coating while venting emissions to STRU 53 is prohibited. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 173	1	The Permittee shall operate EQUI 173 in a permanent total enclosure meeting the requirements of COMG 5. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 173	2	The Permittee shall operate EQUI 173 meeting the requirements of COMG 1. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 174	1	The Permittee shall vent emissions from EQUI 174 to a stack/vent meeting the requirements of STRU 59 whenever EQUI 174 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 174	2	The Permittee shall operate EQUI 174 meeting the requirements of COMG 1. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 174	3	VOC Solvent Distiller Operation: The Permittee shall minimize fugitive VOC emissions and spills during filling, operation, emptying, and clean out of the VOC solvent distiller according to standard operating procedures, including the following: 1) Install a fill sensor or other fail-safe to prevent spilling of recycled VOC solvent during distillation; 2) Ensure that the operator of the distillation equipment remains in close proximity to the equipment while distillation is taking place; 3) Transfer recycled VOC solvent from distiller into containers that include secondary containment; and 4) Empty all distiller bottoms and other residue into a closed container and dispose as hazardous waste. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. ch. 7045, Minn. Stat. 116.385, subd. 3]
EQUI 174	4	The Permittee may only distill dirty solvent that contains 1,2-(trans-) Dichloroethylene from the parts soaker tank (EQUI 173). [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 174	5	1,2-(trans-) Dichloroethylene Content of Distilled Material: The Permittee shall determine the specific content of 1,2-(trans-) Dichloroethylene in distilled material, in weight percent, following the analysis procedure and frequency requirements in Appendix B. Alternatively, the Permittee may analyze the distilled material for VOC and assume all of the VOC in distilled material is 1,2-(trans-) Dichloroethylene. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 176	2200	1,2-(trans-) Dichloroethylene: Emissions Monitoring: The Permittee shall install, operate, and maintain a CEMS to measure 1,2-(trans-) Dichloroethylene emissions discharged to the atmosphere from STRU 73, and shall record the output of the system. [Minn. R. 7017.1006, Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 176	2520	Certification Test Plan due 30 days before Certification Test. Certification Test Pretest Meeting due seven days before Certification Test. Certification Test Report due 45 days aGer Certification Test. The Test Plan and Test Report must be submitted in a format specified by the commissioner. [Minn. R. 7017.1060, subp. 1-3, Minn. R. 7017.1080]
EQUI 176	2530	Continuous Operation: CEMS must be operated and data recorded during all periods of emission unit operation including periods of emission unit start-up, shutdown, or malfunction except for periods of acceptable monitor downtime. This requirement applies whether or not a numerical emission limit applies during these periods. A CEMS must not be bypassed except in emergencies where failure to bypass would endanger human health, safety, or plant equipment. [Minn. R. 7017.1090, Minn. Stat. 116.07, subd. 9(2)]
EQUI 176	2540	Monitoring Data: All data points collected by a CEMS shall be used to calculate individual hourly emission averages unless another applicable requirement requires more frequent averaging. Each hourly average starts at the beginning of the hour and ends at the beginning of the following hour. In order for an hour of data to be considered valid, it must contain the following minimum number of data points: A. four data points, equally spaced, if the emission unit operated during the entire hour; B. two data points, at least 15 minutes apart, during periods of monitor calibration or routine maintenance; C. one data point if the emission unit operated for 15 minutes or less during the hour. Monitoring data shall be recorded in the same units of measurement and averaging period as the facility's emission standard. [Minn. R. 7017.1160, Minn. Stat. 116.07, subd. 9(2)]
EQUI 176	2545	Certification Test Plan: The Permittee shall submit an approvable Certification Test Plan to the Commissioner that contains the following: 1) Name and address of emission facility; 2) Name, title, and telephone number of contact person at facility; 3) Permit number or name and data of applicable compliance document requiring test; 4) Statement of whether the test is an initial certification or a recertification; 5) Drawing of the monitoring system which indicates the location of the reference method ports and monitoring system probe location in relation to the nearest flow disturbances both upstream and downstream of the monitoring system as well as any monitor bypass routes; 6) Make, model, and serial number of the monitor and data recording system; 7) Name and telephone number of testing company; 8) Planned certification test date; 9) List of the performance specifications from Code of Federal Regulations, title 40, part 60, appendix B, which will be followed during the test; 10) List of the reference methods from Code of Federal Regulations, title 40, part 60, appendix A, which will be followed during the test; 11) Units of measurement under which the monitor will be certified, for example, lb/hr, ppm, lb/MMBtu; 12) Monitoring system's span, range, and calibration levels; and 13) Planned emission unit(s) operating range, for example, heat input, steam output, during the certification test. [Minn. R. 7017.1060, Minn. Stat. 116.07, subd. 9(2)]
EQUI 176	2550	QA Plan: Develop and implement a written quality assurance plan that covers each CEMS. The plan must be on site and available for inspection within 30 days after monitor certification. The plan must include the manufacturer's spare parts list for each CEMS and require that those parts be kept at the facility unless the Commissioner gives written approval to exclude specific spare parts from the list. [Minn. R. 7017.1170, subp. 2, Minn. Stat. 116.07, subd. 9(2)]

SI Id	Sequence	Requirement
EQUI 176	2560	CEMS Daily Calibration Drift (CD) Test: The CD shall be quantified and recorded at zero (low-level) and upscale (high-level) gas concentrations at least once daily according to the procedures listed in Minn. R. 7017.1170, subp. 3(A) and (B), 40 CFR Section 60.13(d)(1) or 40 CFR pt. 75, Appendix B as applicable for each pollutant concentration, each diluent monitor, and for each monitor range. If no span value is specified in the applicable requirement or in a compliance document, the Permittee shall use a span value equivalent to 1.5 times the emission limit. [Minn. R. 7017.1170, subp. 3, Minn. Stat. 116.07, subd. 9(2)]
EQUI 176	2570	Relative Accuracy Test Audit (RATA) Notification: due 30 days before CEMS Relative Accuracy Test Audit (RATA). [Minn. R. 7017.1180, subp. 2, Minn. Stat. 116.07, subd. 9(2)]
EQUI 176	2580	CEMS Certification/Recertification Test: due 90 days after the first excess emissions report required for the CEMS or any change which invalidates the monitor's certification status as outlined in Minn. R. 7017.1050, subp. 2. [Minn. R. 7017.1050, subp. 1, Minn. Stat. 116.07, subd. 9(2)]
EQUI 176	2645	Recordkeeping: The owner or operator must retain records of all CEMS monitoring data and support information for a period of five years from the date of the monitoring sample, measurement or report. Records shall be kept at the source. [Minn. R. 7017.1130, Minn. Stat. 116.07, subd. 9(2)]
EQUI 176	2646	The Permittee shall submit start-up notification: Due 10 working days after Startup of Monitor Date. The report shall be certified by the responsible official as defined in Minn. R. 7007.0100, subp. 21(A). The notification shall be submitted electronically on Form CS-02. [Minn. R. 7007.0500, subp. 3, Minn. R. 7007.0800, subp. 2(A)]
EQUI 176	2647	The Permittee shall conduct CEMS cylinder gas audit (CGA): Due by the end of every second QA operating quarter (calendar quarter in which there are at least 168 unit operating hours) except that a CGA is not required during any quarter in which a RATA is performed. The initial CGA must be performed within 180 days following certification of the CEMS. The CGAs shall be conducted according to the procedures outlined in Minn. R. 7017.1170, subp 4a(A). If the monitored emission unit is not in operation on the CGA due date, the owner or operator has a grace period of 168 operating hours to perform the CGA. [Minn. R. 7017.1170, subp. 4a]
EQUI 176	2648	The Permittee shall conduct a relative accuracy test audit: Due by the end of every fourth QA operating quarter (calendar quarter in which there are at least 168 unit operating hours). RATAs shall be conducted and frequency may be reduced according to the procedures outlined in Minn. R. 7017.1170, subp. 5a. If the monitored emission unit is not in operation on the RATA due date, the owner or operator has a grace period of 720 operating hours to perform the RATA. [Minn. R. 7017.1170, subp. 5a]
EQUI 176	2649	Installation Notification: due 60 days before installing the continuous emissions monitoring system. The notification shall include plans and drawings of the system. Additionally, the notification shall include manufacture, model, parameter, and serial numbers of the continuous emissions monitoring system. [Minn. R. 7017.1040, subp. 1]
EQUI 219	2	At the time of permit issuance, EQUI 219 is a UV spray coater as described in Appendix B of this permit and shall comply with the requirements under COMG 1, COMG 2, and COMG 5. EQUI 219 may be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & (B) , Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 219	3	The Permittee shall vent emissions from EQUI 219 to control equipment meeting the requirements of TREA 58 whenever EQUI 219 operates. [Minn. R. 7007.0800, subps. 2(A) & (B) , Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 220	2	At the time of permit issuance, EQUI 220 is a UV spray coater as described in Appendix B of this permit and shall comply with the requirements under COMG 1, COMG 2, and COMG 5. EQUI 220 may be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
EQUI 220	3	The Permittee shall vent emissions from EQUI 220 to control equipment meeting the requirements of TREA 59 whenever EQUI 220 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 221	3455	The Permittee must limit Process Throughput <= 2500.0 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 221	3460	Process Throughput: Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total weight of tin material processed by EQUI 221. This shall be based on written usage logs. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 221	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm each operating day, the Permittee shall calculate and record the following: 1) The total weight of pure tin processed by EQUI 221 for the previous operating day using daily usage records; 2) The total PM10 emissions for the previous operating day using the formulas specified in this permit; and 3) The total PM2.5 emissions for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
EQUI 221	3475	PM < 10 micron: Daily Calculation. The Permittee shall calculate PM10 emissions using the following equation: EQUI221PM10 = [A x B x (1-CE1)] / 24 Where: EQUI221PM10 = daily average PM10 emissions from EQUI 221, in pounds/hour; A = total weight of pure tin processed by EQUI 221 for the previous operating day, in pounds/day; and B = uncontrolled PM10 emission factor for EQUI 221 listed in Appendix D, as a fraction; and CE1 = minimum overall PM10 control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 221	3480	PM < 2.5 micron: Daily Calculation. The Permittee shall calculate PM2.5 emissions using the following equation: EQUI221PM2.5 = [A x C x (1-CE2)] / 24 Where: EQUI221PM2.5 = daily average PM2.5 emissions from EQUI 221, in pounds/hour; A = total weight of pure tin processed by EQUI 221 for the previous operating day, in pounds/day; and C = uncontrolled PM2.5 emission factor for EQUI 221 listed in Appendix D, as a fraction; and CE2 = minimum overall PM2.5 control efficiency required by COMG 11, as a fraction. [Minn. R. 7007.0800, subps. 4-5]
EQUI 221	6430	The Permittee shall vent melt emissions from EQUI 221 to control equipment meeting the requirements of TREA 1 and TREA 60 operated in-series, and COMG 11 whenever EQUI 221 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 221	6450	The Permittee shall vent melt emissions from EQUI 221 to a stack/vent meeting the requirements of STRU 1 whenever EQUI 221 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 221	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 221	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 221	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 221	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 221	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 221	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 223	1879	The Permittee must limit the daily operation of EQUI 223 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 223	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 223 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 224	1879	The Permittee must limit the daily operation of EQUI 224 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 224	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 224 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 225	1879	The Permittee must limit the daily operation of EQUI 225 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 225	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 225 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 226	1879	The Permittee must limit the daily operation of EQUI 226 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 226	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 226 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 227	1879	The Permittee must limit the daily operation of EQUI 227 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 227	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 227 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 228	1879	The Permittee must limit the daily operation of EQUI 228 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 228	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 228 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 229	1879	The Permittee must limit the daily operation of EQUI 229 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 229	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 229 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 230	1879	The Permittee must limit the daily operation of EQUI 230 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 230	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 230 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 231	1879	The Permittee must limit the daily operation of EQUI 231 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 231	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 231 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 232	1879	The Permittee must limit the daily operation of EQUI 232 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 232	1880	Daily Recordkeeping. On each day of operation, the Permittee shall record the time of the day when EQUI 232 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 233	1	The Permittee shall vent emissions from EQUI 233 to a stack/vent meeting the requirements of STRU 50 whenever EQUI 233 operates. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 233	2	At the time of permit issuance, EQUI 233 is a water-based dip coater as described in Appendix B of this permit and shall comply with requirements under COMG 1. EQUI 233 may only be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subps. 2(A) & (B) , Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 233	3	The Permittee shall apply water-based coating from EQUI 172 using dip or drip application methods only unless it is modified as authorized elsewhere in this permit. Spray application of coating while venting emissions to STRU 50 is prohibited. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 240	1	The Permittee shall vent emissions from EQUI 240 to a stack/vent meeting the requirements of STRU 72 whenever EQUI 240 operates. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
EQUI 240	2	At the time of permit issuance, EQUI 240 is a UV spray coater as described in Appendix B of this permit and shall comply with the requirements under COMG 1. EQUI 240 shall comply with the requirements under COMG 2 except for having to comply with the following: 1) operate with control equipment meeting the requirements in COMG 14; and 2) operate in a coating room meeting the requirements of COMG 5. EQUI 240 may be modified as authorized elsewhere in the permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), Title I Condition: Avoid major source under 40 CFR 52.21(b)(1)(i) and Minn. R. 7007.3000, To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 240	3	The Permittee is prohibited from using any coating that contains any hazardous air pollutant (HAP), including the target HAPs as defined under 40 CFR Section 63.11180. [Minn. R. 7007.0800, subps. 2(A)]
EQUI 240	4	Daily Recordkeeping. On each day of operation, the Permittee shall calculate, record, and maintain a record of the total quantity of each coating and other solids-containing material, including the solids content of each coating (as a mass fraction), used by EQUI 240 and the time-of-day EQUI 240 was in operation. This shall be based on written usage logs. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
EQUI 240	3465	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate, record, and maintain a record of the following for the previous operating day using the daily usage records: 1) Total weight of UV coating used by EQUI 240, in pounds/day; and 2) Daily average hourly emissions of PM10 and PM2.5 from EQUI 240 as determined elsewhere in this permit, in pounds/hour. This record shall also include solids contents of each material as determined by the Material Content requirement of this permit. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 240	3475	PM < 10 micron: Daily Calculations. The Permittee shall calculate PM10 emissions from EQUI 240 using the following equations: EQUI240PM10 = I x J where: EQUI240PM10 = daily average PM10 emissions from EQUI 240, in pounds/hour; F = total weight of coating used in EQUI 240 based on daily usage logs, in pounds/day; and G = uncontrolled PM10 emission factor, in pounds PM10 per pound of coating, listed in Appendix B, as a fraction. Other uncontrolled emission factors allowed by this permit shall be based on the most recent MPCA-approved stack test results performed according to approved replicable methodology (ARM) requirements. [Minn. R. 7007.0800, subps. 4-5]
EQUI 240	3480	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate PM2.5 emissions from EQUI 240 using the following equations: EQUI240PM2.5 = I x K where: EQUI240PM2.5 = daily average PM2.5 emissions from EQUI 240, in pounds/hour; F = total weight of coating used in EQUI 240 based on daily usage logs, in pounds/day; and G = uncontrolled PM2.5 emission factor, in pounds PM2.5 per pound of coating, listed in Appendix B, as a fraction. Other uncontrolled emission factors allowed by this permit shall be based on the most recent MPCA-approved stack test results performed according to approved replicable methodology (ARM) requirements. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
EQUI 240	3481	Maximum Contents of Materials and Process Rate: The Permittee assumed certain worst-case contents of materials and process rates when determining the short-term potential to emit of EQUI 240. These assumptions are listed in Appendix B of this permit. Increasing the process rate or changing to a material that has a higher content of any of the given pollutants, or an addition of a pollutant not listed in Appendix B, is considered a change in method of operation that must be evaluated under Minn. R. 7007.1200, subp. 3 to determine if a permit amendment or notification is required under Minn. R. 7007.1150. [Minn. R. 7005.0100, subps. 35a]
EQUI 240	19660	PM < 10 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM10 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM10 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM10 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 240	19661	PM < 10 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM10 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 240	19662	PM < 10 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 240	19663	PM < 2.5 micron: Protocol for Re-Setting the Emission Factor Used For Calculating PM2.5 Emissions: The Permittee shall conduct performance testing under conditions that produce the maximum emission rate, using US EPA reference method 201A and 202 to measure the emission factor as required elsewhere in this permit. Another test method as approved by MPCA in the performance test plan may be used. The Permittee shall report the test result in pound PM2.5 per pound of lead-containing material in the performance test report required by Minn. R. 7017.2035, subp. 1. The emission factor used for calculating emissions shall be re-set to the 3-hour average emission rate in pound PM2.5 per pound of lead-containing material, measured during the most recent MPCA-approved emission factor performance test. The new emission factor used for calculating emissions determined using this Protocol shall be effective upon receipt of the Notice of Compliance (NOC) letter that approves the test results and shall be incorporated into the permit during the next permit amendment. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
EQUI 240	19664	PM < 2.5 micron: The Permittee must apply for and obtain a major permit amendment if the Permittee wishes to deviate from the Protocol for Re-setting the Emission Factor Used for Calculating PM2.5 Emissions established by this permit. [Minn. R. 7007.1500, subp. 1]
EQUI 240	19665	PM < 2.5 micron: Notwithstanding the Protocol detailed above, the MPCA reserves the right to set operational limits and requirements as allowed under Minn. R. 7017.2025. If the MPCA sets limits, the new limits shall be implemented upon receipt of the NOC letter that notifies the Permittee of preliminary approval. The limits set according to Minn. R. 7017.2025 are final upon issuance of a permit amendment incorporating the change. [Minn. R. 7017.2025]
EQUI 240	19666	The Permittee must limit the daily operation of EQUI 240 to the period between 5 am and 11 pm. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
STRU 1	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.1012 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 1	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.1012 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 1	1862	The Permittee shall limit emissions of Lead <= 0.00297 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 1	1863	The Permittee shall limit emissions of Lead <= 1.0835 pounds per year 365-day rolling sum. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 1	1864	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 1 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 1 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 1	1865	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 1 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 1 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual lead emissions from STRU 1 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 1	1866	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 1 using the following equation: STRU1PM10 = EQUI101PM10 + EQUI102PM10 + EQUI103PM10 + EQUI104PM10 + EQUI221PM10 where: STRU1PM10 = total daily average PM10 emissions emitted through STRU 1 from EQUI 101, EQUI 102, EQUI 103, EQUI 104, and EQUI 221, in pounds/hour; EQUI101PM10 = total daily average PM10 stack emissions from EQUI 101, in pounds/hour; EQUI102PM10 = total daily average PM10 stack emissions from EQUI 102, in pounds/hour; EQUI103PM10 = total daily average PM10 stack emissions from EQUI 103, in pounds/hour; EQUI104PM10 = total daily average PM10 stack emissions from EQUI 104, in pounds/hour; and EQUI221PM10 = total daily average PM10 stack emissions from EQUI 221, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 1	1867	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 1 using the following equation: STRU1PM2.5 = EQUI101PM2.5 + EQUI102PM2.5 + EQUI103PM2.5 + EQUI104PM2.5 + EQUI221PM2.5 where: STRU1PM2.5 = total daily average PM2.5 emissions emitted through STRU 1 from EQUI 101, EQUI 102, EQUI 103, EQUI 104, and EQUI 221, in pounds/hour; EQUI101PM2.5 = total daily average PM2.5 stack emissions from EQUI 101, in pounds/hour; EQUI102PM2.5 = total daily average PM2.5 stack emissions from EQUI 102, in pounds/hour; EQUI103PM2.5 = total daily average PM2.5 stack emissions from EQUI 103, in pounds/hour; EQUI104PM2.5 = total daily average PM2.5 stack emissions from EQUI 104, in pounds/hour; and EQUI221PM2.5 = total daily average PM2.5 stack emissions from EQUI 221, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 1	1868	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 1 using the following equations: STRU1L = EQUI101L + EQUI102L + EQUI103L + EQUI 104L STRU1L3A = [(STRU1L2 + STRU1L3 + STRU1L4 +…+ STRU1L91 + STRU1L92 + STRU1L93) – STRU1L1] / 92 days where: STRU1L# = total daily lead emissions emitted through STRU 1 from EQUI 101, EQUI 102, EQUI 103, and EQUI 104, in pounds/day; STRU1L3A = 92-day rolling average lead emissions emitted through STRU 1 from EQUI 101, EQUI 102, EQUI 103, and EQUI 104 for the previous 92-day period, in pounds/day; EQUI101L = total lead stack emissions from EQUI 101, in pounds/day; EQUI102L = total lead stack emissions from EQUI 102, in pounds/day; EQUI103L = total lead stack emissions from EQUI 103, in pounds/day; and EQUI104L = total lead stack emissions from EQUI 104, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 1	1869	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 1 using the following equations: STRU1L = EQUI101L + EQUI102L + EQUI103L + EQUI104L STRU1L365S = (STRU1L2 + STRU1L3 + STRU1L4 +.... + STRU1L364+ STRU1L365+ STRU1L366) – STRU1L1 where: STRU1L# = daily lead emissions emitted through STRU 1 from EQUI 101, EQUI 102, EQUI 103, and EQUI 104, in pounds/day; STRU1L365S = 365-day rolling sum lead emissions emitted through STRU 1 from EQUI 101, EQUI 102, EQUI 103, and EQUI 104 for the previous 365-day period, in pounds/year; EQUI101L = total lead stack emissions from EQUI 101, in pounds/day; EQUI102L = total lead stack emissions from EQUI 102, in pounds/day; EQUI103L = total lead stack emissions from EQUI 103, in pounds/day; and EQUI104L = total lead stack emissions from EQUI 104, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 1	1871	Particulate Matter: The Permittee shall conduct a performance test due before 180 days following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 11. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 5 and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 1	1872	PM < 10 micron: The Permittee shall conduct a performance test due before 180 days following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 11. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. STRU 1	1877	PM < 2.5 micron: The Permittee shall conduct a performance test due before 180 days following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to measure emissions, in pounds per hour. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, ubd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 1	1878	Lead: The Permittee shall conduct a performance test due before 180 days following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereaGer to measure emissions, in pounds per hour. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Method 12, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subp. (A) & (B), Minn. R. 7009.0020-7009.0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
STRU 1	1879	The Permittee is prohibited from releasing emissions of pollutants through STRU 1 from any emission units other than EQUI 101, EQUI 102, EQUI 103, EQUI 104, or EQUI 221 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 15	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.03887 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 15	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.03887 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 15	1862	The Permittee shall limit emissions of Lead <= 0.0230 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 15	1864	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 15 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 15 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 15	1865	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 15 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 15 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual lead emissions from STRU 15 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 15	1866	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 15 using the following equation: STRU15PM10 = EQUI121PM10 + EQUI122PM10 + EQUI123PM10 where: STRU15PM10 = total daily average PM10 emissions emitted through STRU 15 from EQUI 121, EQUI 122, and EQUI 123 , in pounds/hour; EQUI121PM10 = total daily average PM10 stack emissions from EQUI 121, in pounds/hour; EQUI122PM10 = total daily average PM10 stack emissions from EQUI 122, in pounds/hour; and EQUI123PM10 = total daily average PM10 stack emissions from EQUI 123, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 15	1867	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 15 using the following equation: STRU15PM2.5 = EQUI121PM2.5 + EQUI122PM2.5 + EQUI123PM2.5 where: STRU15PM2.5 = total daily average PM2.5 emissions emitted through STRU 15 from EQUI 121, EQUI 122, and EQUI 123, in pounds/hour; EQUI121PM2.5 = total daily average PM2.5 stack emissions from EQUI 121, in pounds/hour; EQUI122PM2.5 = total daily average PM2.5 stack emissions from EQUI 122, in pounds/hour; and EQUI123PM2.5 = total daily average PM2.5 stack emissions from EQUI 123, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 15	1868	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 15 using the following equations: STRU15L = EQUI121L + EQUI122L + EQUI123L STRU15L3A = [(STRU15L2 + STRU15L3 + STRU15L4 +…+ STRU15L91 + STRU15L92 + STRU15L93) – STRU15L1] / 92 days where: STRU15L# = total daily lead emissions emitted through STRU 15 from EQUI 121, EQUI 122, and EQUI 123, in pounds/day; STRU15L3A = 92-day rolling average lead emissions emitted through STRU 15 from EQUI 121, EQUI 122, and EQUI 123 for the previous 92-day period, in pounds/day; EQUI121L = total lead stack emissions from EQUI 121, in pounds/day; EQUI122L = total lead stack emissions from EQUI 122, in pounds/day; and EQUI123L = total lead stack emissions from EQUI 123, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 15	1869	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 15 using the following equations: STRU15L = EQUI121L + EQUI122L + EQUI123L STRU15L365S = (STRU15L2 + STRU15L3 + STRU15L4 +. . . + STRU15L364+ STRU15L365+ STRU15L366) – STRU15L1 where: STRU15L# = daily lead emissions emitted through STRU 15 from EQUI 121, EQUI 122, and EQUI 123, in pounds/day; STRU15L365S = 365-day rolling sum lead emissions emitted through STRU 15 from EQUI 121, EQUI 122, and EQUI 123 for the previous 365-day period, in pounds/year; EQUI121L = total lead stack emissions from EQUI 121, in pounds/day; EQUI122L = total lead stack emissions from EQUI 122, in pounds/day; and EQUI123L = total lead stack emissions from EQUI 123, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 15	1870	Particulate Matter: The Permittee shall conduct a performance test due before 180 days following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. STRU 17	1871	Particulate Matter: The Permittee shall conduct a performance test due before 180 days following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 5 and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. SI Id	Sequence	Requirement
STRU 20	1875	PM < 10 micron: The Permittee shall conduct a performance test due before 12 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to measure emissions, in pounds per hour. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. STRU 20	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 20 from any emission units other than EQUI 132, or EQUI 133 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 23	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.02222 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 23	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.02222 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 23	1862	The Permittee shall limit emissions of Lead <= 0.01314 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 23	1864	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 23 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 23 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 23	1865	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 23 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 23 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual lead emissions from STRU 23 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 23	1866	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 23 using the following equation: STRU23PM10 = EQUI136PM10 where: STRU23PM10 = total daily average PM10 emissions emitted through STRU 23, in pounds/hour; and EQUI136PM10 = total daily average PM10 stack emissions from EQUI 136, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 23	1867	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 23 using the following equation: STRU23PM2.5 = EQUI136PM2.5 where: STRU23PM2.5 = total daily average PM2.5 emissions emitted through STRU 23, in pounds/hour; and EQUI136PM2.5 = total daily average PM2.5 stack emissions from EQUI 136, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 23	1868	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 23 using the following equations: STRU23L = EQUI136L STRU23L3A = [(STRU23L2 + STRU23L3 + STRU23L4 +…+ STRU23L91 + STRU23L92 + STRU23L93) – STRU23L1] / 92 days where: STRU23L# = total daily lead emissions emitted through STRU 23, in pounds/day; STRU23L3A = 92-day rolling average lead emissions emitted through STRU 23 for the previous 92-day period, in pounds/day; and EQUI136L = total lead stack emissions from EQUI 136, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 23	1869	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 23 using the following equations: STRU23L = EQUI136L STRU23L365S = (STRU23L2 + STRU23L3 + STRU23L4 +.... + STRU23L364 + STRU23L365 + STRU23L366) – STRU23L1 where: STRU23L# = total daily lead emissions emitted through STRU 23, in pounds/day; STRU23L365S = 365-day rolling average lead emissions emitted through STRU 23 for the previous 365-day period, in pounds/year; and EQUI136L = total lead stack emissions from EQUI 136, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 23	1871	Particulate Matter: The Permittee shall conduct a performance test due before 24 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. STRU 24	1864	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 24 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 24 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 24	1865	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 24 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 24 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual lead emissions from STRU 24 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 24	1866	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 24 using the following equation: STRU24PM10 = EQUI137PM10 + EQUI138PM10 where: STRU24PM10 = total daily average PM10 emissions emitted through STRU 24, in pounds/hour; EQUI137PM10 = total daily average PM10 stack emissions from EQUI 137, in pounds/hour; and EQUI138PM10 = total daily average PM10 stack emissions from EQUI 138, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 24	1867	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 24 using the following equation: STRU24PM2.5 = EQUI137PM2.5 + EQUI138PM2.5 where: STRU24PM2.5 = total daily average PM2.5 emissions emitted through STRU 24, in pounds/hour; EQUI137PM2.5 = total daily average PM2.5 stack emissions from EQUI 137, in pounds/hour; and EQUI138PM2.5 = total daily average PM2.5 stack emissions from EQUI 138, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 24	1868	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 24 using the following equations: STRU24L = EQUI137L + EQUI138L STRU24L3A = [(STRU24L2 + STRU24L3 + STRU24L4 +…+ STRU24L91 + STRU24L92 + STRU24L93) – STRU24L1] / 92 days where: STRU24L# = total daily lead emissions emitted through STRU 24, in pounds/day; STRU24L3A = 92-day rolling average lead emissions emitted through STRU 24 for the previous 92-day period, in pounds/day; EQUI137L = total lead stack emissions from EQUI 137, in pounds/day; and EQUI138L = total lead stack emissions from EQUI 138, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 24	1869	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 24 using the following equations: STRU24L = EQUI137L + EQUI138L STRU24L365S = (STRU24L2 + STRU24L3 + STRU24L4 +.... + STRU24L364 + STRU24L365 + STRU24L366) – STRU24L1 where: STRU24L# = total daily lead emissions emitted through STRU 24, in pounds/day; STRU24L365S = 365-day rolling sum lead emissions emitted through STRU 24 for the previous 365-day period, in pounds/year; EQUI137L = total lead stack emissions from EQUI 137, in pounds/day; and EQUI138L = total lead stack emissions from EQUI 138, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 24	1871	Particulate Matter: The Permittee shall conduct a performance test due before 24 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 5 and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

STRU 26	1875	PM < 10 micron: The Permittee shall conduct a performance test due before 36 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to measure emissions, in pounds per hour. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. STRU 26	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 26 from any emission units other than EQUI 141, EQUI 142, EQUI 143, or EQUI 155 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 30	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.06048 pounds per hour daily average. [Minn. R. 7007.0800, subps. (A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 30	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.06048 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 30	1862	The Permittee shall limit emissions of Lead <= 0.03577 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 30	1864	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 30 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 30 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 30	1865	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 30 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 30 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual lead emissions from STRU 30 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 30	1866	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 30 using the following equation: STRU30PM10 = EQUI146PM10 + EQUI158PM10 where: STRU30PM10 = total daily average PM10 emissions emitted through STRU 30, in pounds/hour; EQUI146PM10 = total daily average PM10 stack emissions from EQUI 146, in pounds/hour; and EQUI158PM10 = total daily average PM10 stack emissions from EQUI 158, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 30	1867	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 30 using the following equation: STRU30PM2.5 = EQUI146PM2.5 + EQUI158PM2.5 where: STRU30PM2.5 = total daily average PM2.5 emissions emitted through STRU 30, in pounds/hour; EQUI146PM2.5 = total daily average PM2.5 stack emissions from EQUI 146, in pounds/hour; and EQUI158PM2.5 = total daily average PM2.5 stack emissions from EQUI 158, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 30	1868	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 30 using the following equations: STRU30L = EQUI146L + EQUI158L STRU30L3A = [(STRU30L2 + STRU30L3 + STRU30L4 +…+ STRU30L91 + STRU30L92 + STRU30L93) – STRU30L1] / 92 days where: STRU30L# = total daily lead emissions emitted through STRU 30, in pounds/day; STRU30L3A = 92-day rolling average lead emissions emitted through STRU 30 for the previous 92-day period, in pounds/day; EQUI146L = total lead stack emissions from EQUI 146, in pounds/day; and EQUI158L = total lead stack emissions from EQUI 158, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 30	1869	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 30 using the following equations: STRU30L = EQUI146L + EQUI158L STRU30L365S = (STRU30L2 + STRU30L3 + STRU30L4 +.... + STRU30L364 + STRU30L365 + STRU30L366) – STRU30L1 where: STRU30L# = total daily lead emissions emitted through STRU 30, in pounds/day; STRU30L365S = 365-day rolling sum lead emissions emitted through STRU 30 for the previous 365-day period, in pounds/year; EQUI146L = total lead stack emissions from EQUI 146, in pounds/day; and EQUI158L = total lead stack emissions from EQUI 158, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 30	1871	Particulate Matter: The Permittee shall conduct a performance test due before 36 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 5 and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. STRU 31	1862	The Permittee shall limit emissions of Lead <= 0.01764 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 31	1864	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 31 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 31 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 31	1865	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 31 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 31 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual lead emissions from STRU 31 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 31	1866	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 31 using the following equation: STRU31PM10 = EQUI147PM10 where: STRU31PM10 = total daily average PM10 emissions emitted through STRU 31, in pounds/hour; and EQUI147PM10 = total daily average PM10 stack emissions from EQUI 147, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 31	1867	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 31 using the following equation: STRU31PM2.5 = EQUI147PM2.5 where: STRU31PM2.5 = total daily average PM2.5 emissions emitted through STRU 31, in pounds/hour; and EQUI147PM2.5 = total daily average PM2.5 stack emissions from EQUI 147, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 31	1868	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 31 using the following equations: STRU31L = EQUI147L STRU31L3A = [(STRU31L2 + STRU31L3 + STRU31L4 +…+ STRU31L91 + STRU31L92 + STRU31L93) – STRU31L1] / 92 days where: STRU31L# = total daily lead emissions emitted through STRU 31, in pounds/day; STRU31L3A = 92-day rolling average lead emissions emitted through STRU 31 for the previous 92-day period, in pounds/day; and EQUI147L = total lead stack emissions from EQUI 147, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 31	1869	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 31 using the following equations: STRU31L = EQUI147L STRU31L365S = (STRU31L2 + STRU31L3 + STRU31L4 +.... + STRU31L364 + STRU31L365 + STRU31L366) – STRU31L1 where: STRU31L# = total daily lead emissions emitted through STRU 31, in pounds/day; STRU31L365S = 365-day rolling sum lead emissions emitted through STRU 31 for the previous 365-day period, in pounds/year; and EQUI147L = total lead stack emissions from EQUI 147, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 31	1871	Particulate Matter: The Permittee shall conduct a performance test due before 36 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 5 and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

STRU 32	1871	PM < 10 micron: The Permittee shall conduct a performance test due before 36 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 32	1872	PM < 2.5 micron: The Permittee shall conduct a performance test due before 36 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. STRU 33	1875	PM < 10 micron: The Permittee shall conduct a performance test due before 48 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to measure emissions, in pounds per hour. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. STRU 35	1862	The Permittee shall limit emissions of Lead <= 0.01059 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 35	1863	The Permittee shall limit emissions of Lead <= 0.9412 pounds per year 365-day rolling sum. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 35	1864	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 35 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 35 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 35	1865	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 35 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 35 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual lead emissions from STRU 35 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 35	1866	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 35 using the following equation: STRU35PM10 = EQUI117PM10 + EQUI160PM10 where: STRU35PM10 = total daily average PM10 emissions emitted through STRU 35, in pounds/hour; and EQUI117PM10 = total daily average PM10 stack emissions from EQUI 117, in pounds/hour; EQUI160PM10 = total daily average PM10 stack emissions from EQUI 160, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 35	1867	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU35 using the following equation: STRU35PM2.5 = EQUI117PM2.5 + EQUI160PM2.5 where: STRU35PM2.5 = total daily average PM2.5 emissions emitted through STRU 35, in pounds/hour; EQUI117PM2.5 = total daily average PM2.5 stack emissions from EQUI 117, in pounds/hour; and EQUI160PM2.5 = total daily average PM2.5 stack emissions from EQUI 160, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 35	1868	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU35 the following equations: STRU35L = EQUI160L STRU35L3A = [(STRU35L2 + STRU35L3 + STRU35L4 +…+ STRU35L91 + STRU35L92 + STRU35L93) – STRU35L1] / 92 days where: STRU35L# = total daily lead emissions emitted through STRU 35, in pounds/day; STRU35L3A = 92-day rolling average lead emissions emitted through STRU 35 for the previous 92-day period, in pounds/day; and EQUI160L = total lead stack emissions from EQUI 160, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 35	1869	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 35 using the following equations: STRU35L = EQUI160L STRU35L365S = (STRU35L2 + STRU35L3 + STRU35L4 +.... + STRU35L364 + STRU35L365 + STRU35L366) – STRU35L1 where: STRU35L# = total daily lead emissions emitted through STRU 35, in pounds/day; STRU35L365S = 365-day rolling sum lead emissions emitted through STRU 35 for the previous 365-day period, in pounds/year; and EQUI160L = total lead stack emissions from EQUI 160, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 35	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 35 from any emission units other than EQUI 117 or EQUI 160 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
STRU 41	1861	The Permittee shall limit emissions of 1,2-(trans-) Dichloroethylene <= 0.0010 pounds per hour 3-hour average. This emission rate represents uncontrolled emission rates used in modeling and AERA analysis. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)& 9(2), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 41	1861	The Permittee shall limit emissions of Trichloroethylene (TCE) <= 0.00006 pounds per hour from EQUI 167. This emission rate represents uncontrolled emission rates used in modeling and AERA analysis. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)& 9(2), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 41	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 41 from any emission units other than EQUI 167 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. (A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 43	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.01896 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 43	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.01896 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 43	1862	The Permittee shall limit emissions of Lead <= 0.01488 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 43	1864	The Permittee shall limit emissions of Nitrogen Oxides <= 0.1826 pounds per hour 1-hour average This is the emission rate used in modeling and it represents the contributions from EQUI 106 and 109. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 43	1865	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 43 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 43 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 43	1866	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 43 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 43 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 43 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 43	1867	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 43 using the following equation: STRU43PM10 = EQUI124FPM10 + 0.014 + 0.00021 where: STRU43PM10 = total daily average PM10 emissions emitted through STRU 43, in pounds/hour; and EQUI124FPM10 = total daily average uncaptured PM10 emissions from EQUI 124, in pounds/hour 0.014 = total daily average PM10 emission contribution from EQUI106 and EQUI109, in pounds/hr; and 0.00021 = total daily average PM10 emission contribution from EQUI115, in pounds/hr. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 43	1868	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 43 using the following equation: STRU43PM2.5 = EQUI124FPM2.5 + 0.014 + 0.00021 where: STRU43PM2.5 = total daily average PM2.5 emissions emitted through STRU 43, in pounds/hour; and EQUI124FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 124, in pounds/hour. 0.014 = total daily average PM2.5 emission contribution from EQUI106 and EQUI109, in pounds/hr; and 0.00021 = total daily average PM2.5 emission contribution from EQUI115, in pounds/hr. [Minn. R. 7007.0800, subps. 4-5]
STRU 43	1869	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 43 using the following equations: STRU43L = EQUI124FL + 0.00011 STRU43L3A = [(STRU43L2 + STRU43L3 + STRU43L4 + . . . + STRU43L91 + STRU43L92 + STRU43L93) – STRU43L1] / 92 days where: STRU43L# = total daily lead emissions emitted through STRU 43, in pounds/day; STRU43L3A = 92-day rolling average lead emissions emitted through STRU 43 for the previous 92-day period, in pounds/day; EQUI124FL = total uncaptured lead emissions from EQUI 124, in pounds/day; and 0.00011 = lead emission contribution from EQUI115, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 43	1870	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 43 using the following equations: STRU43L = EQUI124FL STRU43L365S = (STRU43L2 + STRU43L3 + STRU43L4 + . . . + STRU43L364 + STRU43L365 + STRU43L366) – STRU43L1 where: STRU43L# = total daily lead emissions emitted through STRU 43, in pounds/day; STRU43L365S = 365-day rolling sum lead emissions emitted through STRU 43 for the previous 365-day period, in pounds/year; and EQUI124FL = total uncaptured lead emissions from EQUI 124, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 43	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 43 from any emission units other than EQUI 106, EQUI 109, EQUI 115, and EQUI 124 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 44	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.07081 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 44	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.07081 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 44	1862	The Permittee shall limit emissions of Lead <= 0.01061 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
STRU 44	1864	The Permittee shall limit emissions of Nitrogen Oxides <= 0.4070 pounds per hour 1-hour average This is the emission rate used in modeling and it represents the contributions from EQUI 107, EQUI 108 and EQUI 111. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 44	1865	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 44 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 44 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 44	1866	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 44 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 44 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 44 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 44	1867	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 44 using the following equation: STRU44PM10 = EQUI130FPM10 + EQUI131FPM10 + EQUI132FPM10 + EQUI133FPM10 + EQUI134FPM10 + EQUI135FPM10 + EQUI136FPM10+ 0.03093 where: STRU44PM10 = total daily average PM10 emissions emitted through STRU 44, in pounds/hour; EQUI130FPM10 = total daily average uncaptured PM10 emissions from EQUI 130, in pounds/hour; EQUI131FPM10 = total daily average uncaptured PM10 emissions from EQUI 131, in pounds/hour; EQUI132FPM10 = total daily average uncaptured PM10 emissions from EQUI 132, in pounds/hour; EQUI133FPM10 = total daily average uncaptured PM10 emissions from EQUI 133, in pounds/hour; EQUI134FPM10 = total daily average uncaptured PM10 emissions from EQUI 134, in pounds/hour; EQUI135FPM10 = total daily average uncaptured PM10 emissions from EQUI 135, in pounds/hour; EQUI136FPM10 = total daily average uncaptured PM10 emissions from EQUI 136, in pounds/hour; and 0.03093 = total daily average PM10 emission contribution from EQUI 107, EQUI 108 and EQUI 111, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 44	1868	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 44 using the following equation: STRU44PM2.5 = EQUI130FPM2.5 + EQUI131FPM2.5 + EQUI132FPM2.5 + EQUI133FPM2.5 + EQUI134FPM2.5 + EQUI135FPM2.5 + EQUI136FPM2.5+ 0.03093 where: STRU44PM2.5 = total daily average PM2.5 emissions emitted through STRU 44, in pounds/hour; EQUI130FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 130, in pounds/hour; EQUI131FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 131, in pounds/hour; EQUI132FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 132, in pounds/hour; EQUI133FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 133, in pounds/hour; EQUI134FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 134, in pounds/hour; EQUI135FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 135, in pounds/hour; EQUI136FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 136, in pounds/hour; and 0.03093 = total daily average PM2.5 emission contribution from EQUI 107, EQUI 108 and EQUI 111, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 44	1869	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 44 using the following equations: STRU44L = EQUI130FL + EQUI131FL + EQUI132FL + EQUI133FL + EQUI134FL + EQUI135FL + EQUI136FL STRU44L3A = [(STRU44L2 + STRU44L3 + STRU44L4 + . . . + STRU44L91 + STRU44L92 + STRU44L93) – STRU44L1] / 92 days where: STRU44L# = total daily lead emissions emitted through STRU 44, in pounds/day; STRU44L3A = 92-day rolling average lead emissions emitted through STRU 44 for the previous 92-day period, in pounds/day; EQUI130FL = total uncaptured lead emissions from EQUI 130, in pounds/day; EQUI131FL = total uncaptured lead emissions from EQUI 131, in pounds/day; EQUI132FL = total uncaptured lead emissions from EQUI 132, in pounds/day; EQUI133FL = total uncaptured lead emissions from EQUI 133, in pounds/day; EQUI134FL = total uncaptured lead emissions from EQUI 134, in pounds/day; EQUI135FL = total uncaptured lead emissions from EQUI 135, in pounds/day; and EQUI136FL = total uncaptured lead emissions from EQUI 136, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 44	1870	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 44 using the following equations: STRU44L = EQUI130FL + EQUI131FL + EQUI132FL + EQUI133FL + EQUI134FL + EQUI135FL + EQUI136FL STRU44L365S = (STRU44L2 + STRU44L3 + STRU44L4 + . . . +STRU44L364 + STRU44L365 + STRU44L366) – STRU44L1 where: STRU44L# = total daily lead emissions emitted through STRU 44, in pounds/day; STRU44L365S = 365-day rolling sum lead emissions emitted through STRU 44 for the previous 365-day period, in pounds/year; EQUI130FL = total uncaptured lead emissions from EQUI 130, in pounds/day; EQUI131FL = total uncaptured lead emissions from EQUI 131, in pounds/day; EQUI132FL = total uncaptured lead emissions from EQUI 132, in pounds/day; EQUI133FL = total uncaptured lead emissions from EQUI 133, in pounds/day; EQUI134FL = total uncaptured lead emissions from EQUI 134, in pounds/day; EQUI135FL = total uncaptured lead emissions from EQUI 135, in pounds/day; and EQUI136FL = total uncaptured lead emissions from EQUI 136, in pounds/day. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
STRU 45	1865	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 45 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 45 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 45	1866	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 45 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 45 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 45 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 45	1867	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 45 using the following equation: STRU45PM10 = EQUI137FPM10 + EQUI138FPM10 + EQUI139FPM10 + EQUI140FPM10 + EQUI141FPM10+ 0.03093 where: STRU45PM10 = total daily average PM10 emissions emitted through STRU 45, in pounds/hour; EQUI137FPM10 = total daily average uncaptured PM10 emissions from EQUI 137, in pounds/hour; EQUI138FPM10 = total daily average uncaptured PM10 emissions from EQUI 138, in pounds/hour; EQUI139FPM10 = total daily average uncaptured PM10 emissions from EQUI 139, in pounds/hour; EQUI140FPM10 = total daily average uncaptured PM10 emissions from EQUI 140, in pounds/hour; EQUI141FPM10 = total daily average uncaptured PM10 emissions from EQUI 141, in pounds/hour; and 0.0303 = total daily average PM10 emission contribution from EQUI 107, EQUI 108 and EQUI 111, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 45	1868	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 45 using the following equation: STRU45PM2.5 = EQUI137FPM2.5 + EQUI138FPM2.5 + EQUI139FPM2.5 + EQUI140FPM2.5 + EQUI141FPM2.5+ 0.03093 where: STRU45PM2.5 = total daily average PM2.5 emissions emitted through STRU 45, in pounds/hour; EQUI137FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 137, in pounds/hour; EQUI138FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 138, in pounds/hour; EQUI139FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 139, in pounds/hour; EQUI140FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 140, in pounds/hour; EQUI141FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 141, in pounds/hour; 0.03093 = total daily average PM2.5 emission contribution from EQUI 107, EQUI 108 and EQUI 111, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 45	1869	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 45 using the following equations: STRU45L = EQUI137FL + EQUI138FL + EQUI139FL + EQUI140FL + EQUI141FL STRU45L3A = [(STRU45L2 + STRU45L3 + STRU45L4 +...+ STRU45L91 + STRU45L92 + STRU45L93) – STRU45L1] / 92 days where: STRU45L# = total daily lead emissions emitted through STRU 45, in pounds/day; STRU45L3A = 92-day rolling average lead emissions emitted through STRU 45 for the previous 92-day period, in pounds/day; EQUI137FL = total uncaptured lead emissions from EQUI 137, in pounds/day; EQUI138FL = total uncaptured lead emissions from EQUI 138, in pounds/day; EQUI139FL = total uncaptured lead emissions from EQUI 139, in pounds/day; EQUI140FL = total uncaptured lead emissions from EQUI 140, in pounds/day; and EQUI141FL = total uncaptured lead emissions from EQUI 141, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 45	1870	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 45 using the following equations: STRU45L = EQUI137FL + EQUI138FL + EQUI139FL + EQUI140FL + EQUI141FL STRU45L365S = (STRU45L2 + STRU45L3 + STRU45L4 +...+ STRU45L364 + STRU45L365 + STRU45L366) – STRU45L1 where: STRU45L# = total daily lead emissions emitted through STRU 45, in pounds /day; STRU45L365S = 365-day rolling sum lead emissions emitted through STRU 45 for the previous 365-day period, in pounds/year; EQUI137FL = total uncaptured lead emissions from EQUI 137, in pounds/day; EQUI138FL = total uncaptured lead emissions from EQUI 138, in pounds/day; EQUI139FL = total uncaptured lead emissions from EQUI 139, in pounds/day; EQUI140FL = total uncaptured lead emissions from EQUI 140, in pounds/day; and EQUI141FL = total uncaptured lead emissions from EQUI 141, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 45	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 45 from any emission units other than EQUI 107, EQUI 108, EQUI 111, EQUI 137, EQUI 138, EQUI 139, EQUI 140 or EQUI 141 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 46	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.04535 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 46	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.04535 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 46	1862	The Permittee shall limit emissions of Lead <= 0.003868 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 46	1864	The Permittee shall limit emissions of Nitrogen Oxides <= 0.4070 pounds per hour 1-hour average This is the emission rate used in modeling and it represents the contributions from EQUI 107, EQUI 108 and EQUI 111. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
STRU 46	1865	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 46 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 46 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 46	1866	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 46 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 46 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 46 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 46	1867	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 46 using the following equation: STRU46PM10 = EQUI142FPM10 + EQUI143FPM10 + EQUI155FPM10 + 0.03093 where: STRU46PM10 = total daily average PM10 emissions emitted through STRU 46, in pounds/hour; EQUI142FPM10 = total daily average uncaptured PM10 emissions from EQUI 142, in pounds/hour; EQUI143FPM10 = total daily average uncaptured PM10 emissions from EQUI 143, in pounds/hour; EQUI155FPM10 = total daily average uncaptured PM10 emissions from EQUI 155, in pounds/hour; and 0.03093 = total daily average PM10 emission contribution from EQUI 107, EQUI 108 and EQUI 111, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 46	1868	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 46 using the following equation: STRU46PM2.5 = EQUI142FPM2.5 + EQUI143FPM2.5 + EQUI155FPM2.5+ 0.03093 where: STRU46PM2.5 = total daily average PM2.5 emissions emitted through STRU 46, in pounds/hour; EQUI142FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 142, in pounds/hour; EQUI143FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 143, in pounds/hour; EQUI155FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 155, in pounds/hour; and 0.03093 = total daily average PM2.5 emission contribution from EQUI 107, EQUI 108 and EQUI 111, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 46	1869	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 46 using the following equations: STRU46L = EQUI142FL + EQUI143FL + EQUI155FL STRU46L3A = [(STRU46L2 + STRU46L3 + STRU46L4 +...+ STRU46L91 + STRU46L92 + STRU46L93) – STRU46L1] / 92 days where: STRU46L# = total daily lead emissions emitted through STRU 46, in pounds/day; STRU46L3A = 92-day rolling average lead emissions emitted through STRU 46 for the previous 92-day period, in pounds/day; EQUI142FL = total uncaptured lead emissions from EQUI 142, in pounds/day; EQUI143FL = total uncaptured lead emissions from EQUI 143, in pounds/day; and EQUI155FL = total uncaptured lead emissions from EQUI 155, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 46	1870	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 46 using the following equations: STRU46L = EQUI142FL + EQUI143FL + EQUI155FL STRU46L365S = (STRU46L2 + STRU46L3 + STRU46L4 +...+ STRU46L364 + STRU46L365 + STRU46L366) – STRU46L1 where: STRU46L# = total daily lead emissions emitted through STRU 46, in pounds/day; STRU46L365S = 365-day rolling sum lead emissions emitted through STRU 46 for the previous 365-day period, in pounds/year; EQUI142FL = total uncaptured lead emissions from EQUI 142, in pounds/day; EQUI143FL = total uncaptured lead emissions from EQUI 143, in pounds/day; and EQUI155FL = total uncaptured lead emissions from EQUI 155, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 46	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 46 from any emission units other than EQUI 107, EQUI 108, EQUI 111, EQUI 142, EQUI 143, or EQUI 155 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) &(B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 47	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.02241 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 47	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.02241 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 47	1862	The Permittee shall limit emissions of Lead <= 0.001958 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 47	1864	The Permittee shall limit emissions of Nitrogen Oxides <= 0.1987 pounds per hour 1-hour average This is the emission rate used in modeling and it represents the contributions from EQUI 106 and EQUI 108. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 47	1865	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 47 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 47 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 47	1866	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 47 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 47 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 47 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 47	1867	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 47 using the following equation: STRU47PM10 = EQUI127FPM10 + EQUI128FPM10 + EQUI129FPM10 + 0.01510 where: STRU47PM10 = total daily average PM10 emissions emitted through STRU 47, in pounds/hour; EQUI127FPM10 = total daily average uncaptured PM10 emissions from EQUI 127, in pounds/hour; EQUI128FPM10 = total daily average uncaptured PM10 emissions from EQUI 128, in pounds/hour; EQUI129FPM10 = total daily average uncapturedPM10 emissions from EQUI 129, in pounds/hour; and 0.01510 = total daily average PM10 emission contribution from EQUI 106 and EQUI 108, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 47	1868	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 47 using the following equation: STRU47PM2.5 = EQUI127FPM2.5 + EQUI128FPM2.5 + EQUI129FPM2.5 + 0.01510 where: STRU47PM2.5 = total daily average PM2.5 emissions emitted through STRU 47, in pounds/hour; EQUI127FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 127, in pounds/hour; EQUI128FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 128, in pounds/hour; EQUI129FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 129, in pounds/hour; and 0.01510 = total daily average PM2.5 emission contribution from EQUI 106 and EQUI 108, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 47	1869	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 47 using the following equations: STRU47L = EQUI127FL + EQUI128FL + EQUI129FL STRU47L3A = [(STRU47L2 + STRU47L3 + STRU47L4 +...+ STRU47L91 + STRU47L92 + STRU47L93) – STRU47L1] / 92 days where: STRU47L# = total daily lead emissions emitted through STRU 47, in pounds/day; STRU47L3A = 92-day rolling average lead emissions emitted through STRU 47 for the previous 92-day period, in pounds/day; EQUI127FL = total uncaptured lead emissions from EQUI 127, in pounds/day; EQUI128FL = total uncaptured lead emissions from EQUI 128, in pounds/day; and EQUI129FL = total uncaptured lead emissions from EQUI 129, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 47	1870	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 47 using the following equations: STRU47L = EQUI127FL + EQUI128FL + EQUI129FL STRU47L365S = (STRU47L2 + STRU47L3 + STRU47L4 +...+ STRU47L364 + STRU47L365 + STRU47L366) – STRU47L1 where: STRU47L# = total daily lead emissions emitted through STRU 47, in pounds/day; STRU47L365S = 365-day rolling sum lead emissions emitted through STRU 47 for the previous 365-day period, in pounds/year; EQUI127FL = total uncaptured lead emissions from EQUI 127, in pounds/day; EQUI128FL = total uncaptured lead emissions from EQUI 128, in pounds/day; and EQUI129FL = total uncaptured lead emissions from EQUI 129, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 47	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 47 from any emission units other than EQUI 106, EQUI 108, EQUI 127, EQUI 128, or EQUI 129 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. STRU 48	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.02520 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 48	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.02520 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 48	1862	The Permittee shall limit emissions of Lead <= 0.003020 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 48	1864	The Permittee shall limit emissions of Nitrogen Oxides <= 0.1826 pounds per hour 1-hour average This is the emission rate used in modeling and it represents the contributions from EQUI 106 and EQUI 109. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 48	1865	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 48 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 48 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 48	1866	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 48 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 48 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 48 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 48	1867	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 48 using the following equation: STRU48PM10 = EQUI121FPM10 + EQUI122FPM10 + 0.01338 where: STRU48PM10 = total daily average PM10 emissions emitted through STRU 48, in pounds/hour; EQUI121FPM10 = total daily average uncaptured PM10 emissions from EQUI 121, in pounds/hour; EQUI122FPM10 = total daily average uncaptured PM10 emissions from EQUI 122, in pounds/hour; and 0.01338 = total daily average PM10 emission contribution from EQUI 106 and EQUI 109, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 48	1868	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 48 using the following equation: STRU48PM2.5 = EQUI121FPM2.5 + EQUI122FPM2.5 + 0.01338 where: STRU48PM2.5 = total daily average PM2.5 emissions emitted through STRU 48, in pounds/hour; EQUI121FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 121, in pounds/hour; EQUI122FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 122, in pounds/hour; and 0.01338 = total daily average PM2.5 emission contribution from EQUI 106 and EQUI 109, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 48	1869	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 48 using the following equations: STRU48L = EQUI121FL + EQUI122FL STRU48L3A = [(STRU48L2 + STRU48L3 + STRU48L4 +...+ STRU48L91 + STRU48L92 + STRU48L93) – STRU48L1] / 92 days where: STRU48L# = total daily lead emissions emitted through STRU 48, in pounds/day; STRU48L3A = 92-day rolling average lead emissions emitted through STRU 48 for the previous 92-day period, in pounds/day; EQUI121FL = total uncaptured lead emissions from EQUI 121, in pounds/day; and EQUI122FL = total uncaptured lead emissions from EQUI 122, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 48	1870	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 48 using the following equations: STRU48L = EQUI121FL + EQUI122FL STRU48L365S = (STRU48L2 + STRU48L3 + STRU48L4 +...+ STRU48L364 + STRU48L365 + STRU48L366) – STRU48L1 where: STRU48L# = total daily lead emissions emitted through STRU 48, in pounds/day; STRU48L365S = 365-day rolling sum lead emissions emitted through STRU 48 for the previous 365-day period, in pounds/year; EQUI121FL = total uncaptured lead emissions from EQUI 121, in pounds/day; and EQUI122FL = total uncaptured lead emissions from EQUI 122, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 48	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 48 from any emission units other than EQUI 106, EQUI 109, EQUI 121 or EQUI 122 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 49	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.01779 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 49	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.01779 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 49	1862	The Permittee shall limit emissions of Lead <= 0.001057 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 49	1864	The Permittee shall limit emissions of Nitrogen Oxides <= 0.1823 pounds per hour 1-hour average This is the emission rate used in modeling and it represents the contributions from EQUI 106 and EQUI 109. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 49	1865	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 49 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 49 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 49	1866	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 49 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 49 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 49 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 49	1867	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 49 using the following equation: STRU49PM10 = EQUI123FPM10 + 0.01338 where: STRU49PM10 = total daily average PM10 emissions emitted through STRU 49, in pounds/hour; EQUI123FPM10 = total daily average uncaptured PM10 emissions from EQUI 123, in pounds/hour; and 0.01338 = total daily average PM10 emission contribution from EQUI 106 and EQUI 109, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 49	1868	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 49 using the following equation: STRU49PM2.5 = EQUI123FPM2.5 + 0.01338 where: STRU49PM2.5 = total daily average PM2.5 emissions emitted through STRU 49, in pounds/hour; EQUI123FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 123, in pounds/hour; and 0.01338 = total daily average PM2.5 emission contribution from EQUI 106 and EQUI 109, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 49	1869	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 49 using the following equations: STRU49L = EQUI123FL STRU49L3A = [(STRU49L2 + STRU49L3 + STRU49L4 +...+ STRU49L91 + STRU49L92 + STRU49L93) – STRU49L1] / 92 days where: STRU49L# = total daily lead emissions emitted through STRU 49, in pounds/day; STRU49L3A = 92-day rolling average lead emissions emitted through STRU 49 for the previous 92-day period, in pounds/day; and EQUI123FL = total uncaptured lead emissions from EQUI 123, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 49	1870	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 49 using the following equations: STRU49L = EQUI123FL STRU49L365S = (STRU49L2 + STRU49L3 + STRU49L4 +...+ STRU49L364 + STRU49L365 + STRU49L366) – STRU49L1 where: STRU49L# = total daily lead emissions emitted through STRU 49, in pounds/day; STRU49L365S = 365-day rolling sum lead emissions emitted through STRU 49 for the previous 365-day period, in pounds/year; and EQUI123FL = total uncaptured lead emissions from EQUI 123, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 49	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 49 from any emission units other than EQUI 106, EQUI 109 or EQUI 123 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. STRU 52	1865	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 52 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 52 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 52	1866	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 52 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 52 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 52 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 52	1867	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 52 using the following equation: STRU52PM10 = EQUI147FPM10 + EQUI158FPM10 + 0.01864 where: STRU52PM10 = total daily average PM10 emissions emitted through STRU 52, in pounds/hour; EQUI147FPM10 = total daily average uncaptured PM10 emissions from EQUI 147, in pounds/hour; EQUI158FPM10 = total daily average uncaptured PM10 emissions from EQUI 158, in pounds/hour; and 0.01864 = total daily average PM10 emission contribution from EQUI 110 and EQUI 112, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 52	1868	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 52 using the following equation: STRU52PM2.5 = EQUI147FPM2.5 + EQUI158FPM2.5 + 0.01864 where: STRU52PM2.5 = total daily average PM2.5 emissions emitted through STRU 52, in pounds/hour; EQUI147FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 147, in pounds/hour; and EQUI158FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 158, in pounds/hour; and 0.01864 = total daily average PM2.5 emission contribution from EQUI 110 and EQUI 112, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 52	1869	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 52 using the following equations: STRU52L = EQUI147FL + EQUI158FL STRU52L3A = [(STRU52L2 + STRU52L3 + STRU52L4 +...+ STRU52L91 + STRU52L92 + STRU52L93) – STRU52L1] / 92 days where: STRU52L# = total daily lead emissions emitted through STRU 52, in pounds/day; STRU52L3A = 92-day rolling average lead emissions emitted through STRU 52 for the previous 92-day period, in pounds/day; EQUI147FL = total uncaptured lead emissions from EQUI 147, in pounds/day; and EQUI158FL = total uncaptured lead emissions from EQUI 158, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 52	1870	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 52 using the following equations: STRU52L = EQUI147FL + EQUI158FL STRU52L365S = (STRU52L2 + STRU52L3 + STRU52L4 +...+ STRU52L364 + STRU52L365 + STRU52L366) – STRU52L1 where: STRU52L# = total daily lead emissions emitted through STRU 52, in pounds/day; STRU52L365S = 365-day rolling sum lead emissions emitted through STRU 52 for the previous 365-day period, in pounds/year; EQUI147FL = total uncaptured lead emissions from EQUI 147, in pounds/day; and EQUI158FL = total uncaptured lead emissions from EQUI 158, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]
STRU 52	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 52 from any emission units other than EQUI 110, EQUI 112, EQUI 147 or EQUI 158 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A)& (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 53	1860	The Permittee shall limit emissions of PM < 10 micron <= 0.03630 pounds per hour daily average. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 53	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.03630 pounds per hour daily average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 53	1862	The Permittee shall limit emissions of Lead <= 0.004705 pounds per day 92-day rolling average. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 53	1864	The Permittee shall limit emissions of Nitrogen Oxides <= 0.2453 pounds per hour 1-hour average This is the emission rate used in modeling and it represents the contributions from EQUI 110 and EQUI 112. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 53	1866	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 53 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 53 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 53	1867	Lead: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following using the formulas specified in this permit: 1) The total lead emissions from STRU 53 the previous operating day using formulas specified in this permit; 2) The 92-day rolling average daily lead emissions from STRU 53 for the previous 92-day period using formulas specified in this permit; and 3) The 365-day rolling sum annual die casting lead emissions from STRU 53 for the previous 365-day period using formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 53	1868	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 53 using the following equation: STRU53PM10 = EQUI146FPM10 + EQUI150FPM10 + 0.01864 where: STRU53PM10 = total daily average PM10 emissions emitted through STRU 53, in pounds/hour; EQUI146FPM10 = total daily average uncaptured PM10 emissions from EQUI 146, in pounds/hour; EQUI150FPM10 = total daily average uncaptured PM10 emissions from EQUI 150, in pounds/hour: and 0.01864 = total daily average PM10 emission contribution from EQUI 110 and EQUI 112, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 53	1869	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 53 using the following equation: STRU53PM2.5 = EQUI146FPM2.5 + EQUI150FPM2.5 + 0.01864 where: STRU53PM2.5 = total daily average PM2.5 emissions emitted through STRU 53, in pounds/hour; EQUI146FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 146, in pounds/hour; EQUI150FPM2.5 = total daily average uncaptured PM2.5 emissions from EQUI 150, in pounds/hour; and 0.01864 = total daily average PM10 emission contribution from EQUI 110 and EQUI 112, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 53	1870	Lead: Daily Calculations (92-Day Rolling Average). The Permittee shall calculate the 92-day rolling average daily lead emissions from STRU 53 using the following equations: STRU53L = EQUI146FL + EQUI150FL STRU53L3A = [(STRU53L2 + STRU53L3 + STRU53L4 +...+ STRU53L91 + STRU53L92 + STRU53L93) – STRU53L1] / 92 days where: STRU53L# = total daily lead emissions emitted through STRU 53, in pounds/day; STRU53L3A = 92-day rolling average lead emissions emitted through STRU 53 for the previous 92-day period, in pounds/day; EQUI146FL = total uncaptured lead emissions from EQUI 146, in pounds/day; and EQUI150FL = total uncaptured lead emissions from EQUI 150, in pounds/day. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 53	1871	Lead: Daily Calculations (365-Day Rolling Sum). The Permittee shall calculate the 365-day rolling sum annual lead emissions from STRU 53 using the following equations: STRU53L = EQUI146FL + EQUI150FL STRU53L365S = (STRU53L2 + STRU53L3 + STRU53L4 +...+ STRU53L364 + STRU53L365 + STRU53L366) – STRU53L1 where: STRU53L# = total daily lead emissions emitted through STRU 53, in pounds/day; STRU53L365S = 365-day rolling sum lead emissions emitted through STRU 53 for the previous 365-day period, in pounds/year; EQUI146FL = total uncaptured lead emissions from EQUI 146, in pounds/day; and EQUI150FL = total uncaptured lead emissions from EQUI 150, in pounds/day. STRU 57	1861	The Permittee shall limit emissions of PM < 2.5 micron <= 0.00109 pounds per hour 3-hour average This is the emission rate used in modeling and it represents controlled emissions at process capacity. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 57	1862	The Permittee shall limit emissions of Lead <= 0.00002 pounds per day 3-hour average This is the emission rate used in modeling and it represents controlled emissions at capacity. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
STRU 57	1871	PM < 10 micron: The Permittee shall conduct a performance test due before 12 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to measure controlled emissions, in pounds per hour at maximum operating rate of EQUI 113 and EQUI 114. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

STRU 73	19890	Particulate Matter: Daily Recordkeeping. By 4:30pm on each day of operation, the Permittee shall calculate and record the following: 1) The total daily average hourly PM10 emissions from STRU 73 for the previous operating day using the formulas specified in this permit; and 2) The total daily average hourly PM2.5 emissions from STRU 73 for the previous operating day using the formulas specified in this permit. [Minn. R. 7007.0800, subps. 4-5]
STRU 73	20080	PM < 10 micron: Daily Calculations. The Permittee shall calculate the average daily PM10 emissions from STRU 73 using the following equation: STRU73PM10 = PM10UV + PM10VOC + PM10WB where: STRU73PM10 = total daily average PM10 emissions emitted through STRU 73 from all EQUIs in COMG 2, COMG 4, and COMG 8, in pounds/hour; PM10UV = total daily average PM10 emissions from all EQUIs in COMG 2, in pounds/hour; PM10VOC = total daily average PM10 emissions from all EQUIs in COMG 4, in pounds/hour; PM10WB = total daily average PM10 emissions from all EQUIs in COMG 8, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]
STRU 73	20081	PM < 2.5 micron: Daily Calculations. The Permittee shall calculate the average daily PM2.5 emissions from STRU 73 using the following equations: STRU73PM2.5 = PM2.5UV + PM2.5VOC + PM2.5WB where: STRU73PM2.5 = total daily average PM2.5 emissions emitted through STRU 73 from all EQUIs in COMG 2, COMG 4, and COMG 8, in pounds/hour; PM2.5UV = total daily average PM2.5 emissions from COMG 2, in pounds/hour; PM2.5VOC = total daily average PM2.5 emissions from COMG 4, in pounds/hour; PM2.5WB = total daily average PM2.5 emissions from COMG 8, in pounds/hour. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
STRU 73	20082	Permit No. 12300341-101 and every 60 months thereafter to verify compliance with the PM10 emission limit of 0.01012 pounds per hour daily average. This test shall be conducted concurrently with the PM2.5 performance test. The Permittee shall calculate emissions of all units operating during the test using the methods described elsewhere in this permit. The total emissions calculated in this manner shall be compared to the measured emissions during the test. If the calculated emissions are equal or higher than the measured emissions, the Permittee will continue to use the emission calculations prescribed in this permit. If measured emissions are higher than calculated emissions, the Permittee must submit a plan to revise emission factors within 30 days of receiving the Notice of Compliance. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing.
STRU 73	20083	Permit No. 12300341-101 and every 60 months thereafter to measure emissions to verify compliance with the PM2.5 emission limit of 0.01012 pounds per hour daily average. This shall be conducted concurrently with the PM10 performance test. The Permittee shall calculate emissions of all units operating during the test using the methods described elsewhere in this permit. The total emissions calculated in this manner shall be compared to the measured emissions during the test. If the calculated emissions are equal or higher than the measured emissions, the Permittee will continue to use the emission calculations prescribed in this permit. If measured emissions are higher than calculated emissions, the Permittee must submit a plan to revise emission factors within 30 days of receiving the Notice of Compliance. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 74	1872	PM < 2.5 micron: The Permittee shall conduct a performance test due before 12 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to verify the emission factor described in Appendix D, and determine overall control efficiency of control equipment train under COMG 12. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
STRU 75	1876	PM < 2.5 micron: The Permittee shall conduct a performance test due before 12 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereafter to measure emissions, in pounds per hour. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Methods 201A and 202, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subps. 2(A) & 2(B), Minn. R. 7009.0020-0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
STRU 75	1877	Lead: The Permittee shall conduct a performance test due before 12 months following issuance of Permit No. 12300341-101 and at a minimum every 60 months thereaGer to measure emissions, in pounds per hour. The Commissioner will set the subsequent test frequency as stated in a Notice of Compliance (NOC) or Notice of Performance Test Verification (NOPTV) letter with review of the initial performance test. Subsequent tests shall be completed no less than every 60-months by the due date (month and day) based on the initial test date or more frequently as stated in the NOC/NOPTV letter. If the Commissioner sets a test frequency at less than every 60 months, the Permittee must apply for an administrative amendment to incorporate the prescribed test frequency into the permit. A major amendment is required to reduce the test frequency once set in the permit. The performance test shall be conducted at worst-case conditions defined at Minn. R. 7017.2005, subp. 8 or at the operating conditions described at Minn. R. 7017.2025, subp. 2, using EPA Reference Method 12, or other method approved by MPCA in the performance test plan approval. The operating conditions during the test, and required recordkeeping and reporting are described in Appendix E. Testing conducted during the 60 days prior to a performance test due date will not reset the due date for future testing. Testing conducted more than 60 days prior to the specified due date satisfies this test due date requirement but will reset future performance test due dates based on the most recent performance test date. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. R. 7017.2020, subp. 1, Minn. Stat. 116.07, subd. 4a(a)]
STRU 75	1878	The Permittee is prohibited from releasing emissions of pollutants through STRU 75 from any emission units other than EQUI 134 or EQUI 135 without obtaining a major amendment to this permit to revise emission limits and compliance demonstration methods based on revised dispersion modeling as described elsewhere in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7007.1500, subp. 1(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]

SI Id	Sequence	Requirement
TREA 1	18220	The Permittee shall vent controlled emissions from EQUIs 101, 102, 103, 104, and 221 as exhausted from TREA 60 to TREA 1 whenever EQUIs 101, 102, 103, 104, or 221 operate, and operate and maintain TREA 1 at all times that any emissions are vented to TREA 1. The Permittee shall document periods of non-operation of TREA 1 whenever EQUIs 101, 102, 103, 104, or 221 are operating. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 1	18240	The Permittee shall comply with the requirements of COMG 11 whenever emissions are vented to TREA 1. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 1	18250	The Permittee shall operate and maintain the electrostatic precipitator (ESP) in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
TREA 1	18260	Data Collection: The Permittee shall maintain a continuous hard copy readout or computer disk file that shows the On/Off condition of the ESP at all times. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 1	18270	Daily Monitoring: The Permittee shall physically verify the operation of the Continuous Parameter Monitoring System (CPMS) at least once each operating day to verify that it is working and recording properly. The Permittee shall maintain a written record of the daily verifications. [Minn. R. 7007.0800, subps. 4-5]
TREA 1	18280	Monitoring Equipment: The Permittee must install and maintain a continuous parameter monitoring system (CPMS) for monitoring the ESP On/Off condition as required by this permit. The monitoring equipment must be installed, in use, and properly maintained, including maintaining the necessary parts for routine repairs of the monitoring equipment, whenever operation of the monitored control equipment is required. [Minn. R. 7007.0800, subps. 4-5]
TREA 1	18300	Quarterly Inspections: At least once per calendar quarter, or more frequently if required by the manufacturer, the Permittee shall inspect the control equipment components that are subject to wear or plugging, for example: bearings, belts, hoses, fans, nozzles, orifices, and ducts. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 1	19600	Annual Inspections: At least once per calendar year, or more frequently if required by the manufacturer, the Permittee shall inspect the control equipment components not covered by the quarterly inspections. This includes, but is not limited to, components that are not subject to wear or plugging including structural components, housings, and hoods. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 1	19631	Corrective Actions: The Permittee shall take corrective action as soon as possible if any of the following occur: - any recorded operating parameter is outside the required operating range (e.g., total power input); or - the ESP or any of its components are found during the inspections to need repair. Corrective actions shall return operation to within the permitted range and/or include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the) O & M Plan for the ESP. The Permittee shall keep a record of the type and date of any corrective action taken for the ESP. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 1	19632	Pre-Filter and Cell Maintenance: The Permittee shall transport pre-filters and cells in leak-proof containers during cleaning, replacement, or performing other maintenance. The Permittee shall dispose of all lead-soiled materials including, but not limited to, dishwasher waste water, mop heads, rags, personal protective equipment (PPE), vacuum bags, and any other material soiled or otherwise in contact with lead as hazardous waste. [Minn. R. 7007.0800, subp. 2, Minn. R. ch. 7045]

SI Id	Sequence	Requirement
TREA 25	18220	The Permittee shall vent controlled emissions from EQUIs 121, 122, and 123 as exhausted from TREA 61 to TREA 25 whenever EQUIs 121, 122, or 123 operate, and operate and maintain TREA 25 at all times that any emissions are vented to TREA 25. The Permittee shall document periods of non-operation of TREA 25 whenever EQUIs 121, 122, or 123 are operating. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. TREA 30	18260	Data Collection: The Permittee shall maintain a continuous hard copy readout or computer disk file that shows the On/Off condition of the ESP at all times. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 30	18280	Quarterly Inspections: At least once per calendar quarter, or more frequently if required by the manufacturer, the Permittee shall inspect the control equipment components that are subject to wear or plugging, for example: bearings, belts, hoses, fans, nozzles, orifices, and ducts. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 30	18280	Monitoring Equipment: The Permittee must install and maintain a continuous parameter monitoring system (CPMS) for monitoring the ESP On/Off condition as required by this permit. The monitoring equipment must be installed, in use, and properly maintained, including maintaining the necessary parts for routine repairs of the monitoring equipment, whenever operation of the monitored control equipment is required. [Minn. R. 7007.0800, subps. 4-5]
TREA 30	18300	Annual Inspections: At least once per calendar year, or more frequently if required by the manufacturer, the Permittee shall inspect the control equipment components not covered by the quarterly inspections. This includes, but is not limited to, components that are not subject to wear or plugging including structural components, housings, and hoods. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 30	19600	Corrective Actions: The Permittee shall take corrective action as soon as possible if any of the following occur: - any recorded operating parameter is outside the required operating range (e.g., total power input); or - the ESP or any of its components are found during the inspections to need repair. Corrective actions shall return operation to within the permitted range and/or include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the) O & M Plan for the ESP. The Permittee shall keep a record of the type and date of any corrective action taken for the ESP. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 30	19631	Pre-Filter and Cell Maintenance: The Permittee shall transport pre-filters and cells in leak-proof containers during cleaning, replacement, or performing other maintenance. The Permittee shall dispose of all lead-soiled materials including, but not limited to, dishwasher waste water, mop heads, rags, personal protective equipment (PPE), vacuum bags, and any other material soiled or otherwise in contact with lead as hazardous waste. [Minn. R. 7007.0800, subp. 2, Minn. R. ch. 7045]

SI Id	Sequence	Requirement
TREA 33	18220	The Permittee shall vent controlled emissions from EQUI 136 as exhausted from TREA 68 to TREA 33 whenever EQUI 136 operates, and operate and maintain TREA 33 at all times that any emissions are vented to TREA 33. The Permittee shall document periods of non-operation of TREA 33 whenever EQUI 136 is operating. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. R. 7007.0800, subp. 5]
TREA 39	19600	Corrective Actions: The Permittee shall take corrective action as soon as possible if any of the following occur: - any recorded operating parameter is outside the required operating range (e.g., total power input); or - the ESP or any of its components are found during the inspections to need repair. Corrective actions shall return operation to within the permitted range and/or include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the) O & M Plan for the ESP. The Permittee shall keep a record of the type and date of any corrective action taken for the ESP. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 39	19631	Pre-Filter and Cell Maintenance: The Permittee shall transport pre-filters and cells in leak-proof containers during cleaning, replacement, or performing other maintenance. The Permittee shall dispose of all lead-soiled materials including, but not limited to, dishwasher waste water, mop heads, rags, personal protective equipment (PPE), vacuum bags, and any other material soiled or otherwise in contact with lead as hazardous waste. [Minn. R. 7007.0800, subp. 2, Minn. R. ch. 7045]

SI Id	Sequence	Requirement
TREA 40	18220	The Permittee shall vent controlled emissions from EQUI 147 as exhausted from TREA 74 to TREA 40 whenever EQUI 147 operates, and operate and maintain TREA 40 at all times that any emissions are vented to TREA 40. The Permittee shall document periods of non-operation of TREA 40 whenever EQUI 147 is operating. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 40	18230	The Permittee shall comply with the requirements of COMG 12 whenever emissions are vented to TREA 40. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 40	18240	The Permittee shall operate and maintain the electrostatic precipitator (ESP) in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
TREA 40	18260	Daily Monitoring: The Permittee shall physically verify the operation of the Continuous Parameter Monitoring System (CPMS) at least once each operating day to verify that it is working and recording properly. The Permittee shall maintain a written record of the daily verifications. [Minn. R. 7007.0800, subps. 4-5]
TREA 40	18260	Data Collection: The Permittee shall maintain a continuous hard copy readout or computer disk file that shows the On/Off condition of the ESP at all times. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 40	18280	Quarterly Inspections: At least once per calendar quarter, or more frequently if required by the manufacturer, the Permittee shall inspect the control equipment components that are subject to wear or plugging, for example: bearings, belts, hoses, fans, nozzles, orifices, and ducts. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 40	18280	Monitoring Equipment: The Permittee must install and maintain a continuous parameter monitoring system (CPMS) for monitoring the ESP On/Off condition as required by this permit. The monitoring equipment must be installed, in use, and properly maintained, including maintaining the necessary parts for routine repairs of the monitoring equipment, whenever operation of the monitored control equipment is required. [Minn. R. 7007.0800, subps. 4-5]
TREA 40	18300	Annual Inspections: At least once per calendar year, or more frequently if required by the manufacturer, the Permittee shall inspect the control equipment components not covered by the quarterly inspections. This includes, but is not limited to, components that are not subject to wear or plugging including structural components, housings, and hoods. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 40	19600	Corrective Actions: The Permittee shall take corrective action as soon as possible if any of the following occur: - any recorded operating parameter is outside the required operating range (e.g., total power input); or - the ESP or any of its components are found during the inspections to need repair. Corrective actions shall return operation to within the permitted range and/or include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the) O & M Plan for the ESP. The Permittee shall keep a record of the type and date of any corrective action taken for the ESP. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 40	19631	Pre-Filter and Cell Maintenance: The Permittee shall transport pre-filters and cells in leak-proof containers during cleaning, replacement, or performing other maintenance. The Permittee shall dispose of all lead-soiled materials including, but not limited to, dishwasher waste water, mop heads, rags, personal protective equipment (PPE), vacuum bags, and any other material soiled or otherwise in contact with lead as hazardous waste. [Minn. R. 7007.0800, subp. 2, Minn. R. ch. 7045]

SI Id	Sequence	Requirement
TREA 41	18220	The Permittee shall vent controlled emissions from EQUIs 149 and 150 as exhausted from TREA 75 to TREA 41 whenever EQUIs 149 or 150 operate, and operate and maintain TREA 41 at all times that any emissions are vented to TREA 41. The Permittee shall document periods of non-operation of the control equipment TREA 41 whenever EQUIs 149 or 150 are operating. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

TREA 61	18680	The Permittee shall vent emissions from EQUIs 121, 122, and 123 to TREA 61 whenever EQUIs 121, 122, or 123 are operating, and operate and maintain TREA 61 at all times that any emissions are vented to TREA 61. The Permittee shall document periods of non-operation of the control equipment TREA 61 whenever EQUIs 121, 122, or 123 are operating. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 61	18687	Pressure Drop: Daily Recordkeeping. The Permittee shall record the time and date of each pressure drop reading and whether or not the recorded pressure drop was within the range specified in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 61	18690	The Permittee shall comply with the requirements of COMG 12 whenever emissions are vented to TREA 61. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 61	18700	Daily Inspections: Once each operating day, the Permittee shall verify if the pressure drop reading is such that filter maintenance is required as per manufacturer's specifications. If maintenance is required, the permittee shall proceed to clean the unit as per manufacturer's specifications before the unit is placed on operation the next day. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TREA 61	18701	The Permittee shall operate and maintain the Stage 1, Stage 2, and HEPA filter in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
TREA 61	18702	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the control equipment components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 61	18703	Corrective Actions: If the filters or any of their components are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan for the filter. The Permittee shall keep a record of the type and date of any corrective action taken for each filter. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]

SI Id	Sequence	Requirement
TREA 62	17611	The Permittee shall limit Stage 1 Filter Pressure Drop >= 0.0001 and <= 0.600 kilopascals, unless a new range is set pursuant to Minn. R. 7017.2025, subp. 3 based on the values recorded during the most recent MPCA-approved performance test where compliance was demonstrated. The new range shall be implemented upon receipt of the Notice of Compliance letter granting preliminary approval. The range is final upon issuance of a permit amendment incorporating the change. The Permittee shall record the pressure drop at least once every 24 hours. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. The Permittee shall document periods of non-operation of the control equipment TREA 66 whenever EQUIs 132 or 133 are operating. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 66	18686	The Permittee comply with the requirements of COMG 12 whenever emissions are vented to TREA 66. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 66	18687	Pressure Drop: Daily Recordkeeping. The Permittee shall record the time and date of each pressure drop reading and whether or not the recorded pressure drop was within the range specified in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 66	18700	The Permittee shall operate and maintain the Stage 1, Stage 2, and HEPA filter in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]

SI Id	Sequence	Requirement
TREA 66	18700	Daily Inspections: Once each operating day, the Permittee shall verify if the pressure drop reading is such that filter maintenance is required as per manufacturer's specifications. If maintenance is required, the permittee shall proceed to clean the unit as per manufacturer's specifications before the unit is placed on operation the next day. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TREA 66	18701	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the control equipment components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 66	18702	Corrective Actions: If the filters or any of their components are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan for the filter. The Permittee shall keep a record of the type and date of any corrective action taken for each filter. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 67	17611	The Permittee shall limit Stage 1 Filter Pressure Drop >= 0.0001 and <= 0.600 kilopascals, unless a new range is set pursuant to Minn. R. 7017.2025, subp. 3 based on the values recorded during the most recent MPCA-approved performance test where compliance was demonstrated. The new range shall be implemented upon receipt of the Notice of Compliance letter granting preliminary approval. The range is final upon issuance of a permit amendment incorporating the change. The Permittee shall record the pressure drop at least once every 24 hours. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 67	18671	The Permittee shall limit Stage 2 Filter Pressure Drop >= 0.0001 and <= 0.800 kilopascals, unless a new range is set pursuant to Minn. R. 7017.2025, subp. 3 based on the values recorded during the most recent MPCA-approved performance test where compliance was demonstrated. The new range shall be implemented upon receipt of the Notice of Compliance letter granting preliminary approval. The range is final upon issuance of a permit amendment incorporating the change. The Permittee shall record the pressure drop at least once every 24 hours. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 67	18680	The Permittee shall vent emissions from EQUIs 134 and 135 to TREA 67 whenever EQUIs 134 or 135 are operating, and operate and maintain TREA 67 at all times that any emissions are vented to TREA 67. The Permittee shall document periods of non-operation of the control equipment TREA 67 whenever EQUIs 134 or 135 are operating. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 67	18686	The Permittee comply with the requirements of COMG 12 whenever emissions are vented to TREA 67. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 67	18687	Pressure Drop: Daily Recordkeeping. The Permittee shall record the time and date of each pressure drop reading and whether or not the recorded pressure drop was within the range specified in this permit. [Minn. The Permittee shall document periods of non-operation of the control equipment TREA 71 whenever EQUIs 141 or 143 are operating. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 71	18686	The Permittee comply with the requirements of COMG 12 whenever emissions are vented to TREA 71. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 71	18687	Pressure Drop: Daily Recordkeeping. The Permittee shall record the time and date of each pressure drop reading and whether or not the recorded pressure drop was within the range specified in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 71	18700	The Permittee shall operate and maintain the Stage 1, Stage 2, and HEPA filter in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
TREA 71	18700	Daily Inspections: Once each operating day, the Permittee shall verify if the pressure drop reading is such that filter maintenance is required as per manufacturer's specifications. If maintenance is required, the permittee shall proceed to clean the unit as per manufacturer's specifications before the unit is placed on operation the next day. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TREA 71	18701	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the control equipment components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 71	18702	Corrective Actions: If the filters or any of their components are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan for the filter. The Permittee shall keep a record of the type and date of any corrective action taken for each filter. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 72	17611	The Permittee shall limit Stage 1 Filter Pressure Drop >= 0.0001 and <= 0.600 kilopascals, unless a new range is set pursuant to Minn. R. 7017.2025, subp. 3 based on the values recorded during the most recent MPCA-approved performance test where compliance was demonstrated. The new range shall be implemented upon receipt of the Notice of Compliance letter granting preliminary approval. The range is final upon issuance of a permit amendment incorporating the change. The Permittee shall record the pressure drop at least once every 24 hours. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 72	18671	The Permittee shall limit Stage 2 Filter Pressure Drop >= 0.0001 and <= 0.800 kilopascals, unless a new range is set pursuant to Minn. R. 7017.2025, subp. 3 based on the values recorded during the most recent MPCA-approved performance test where compliance was demonstrated. The new range shall be implemented upon receipt of the Notice of Compliance letter granting preliminary approval. The range is final upon issuance of a permit amendment incorporating the change. The Permittee shall record the pressure drop at least once every 24 hours. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 72	18680	The Permittee shall vent emissions from EQUIs 142 and 155 to TREA 72 whenever EQUIs 142 or 155 are operating, and operate and maintain TREA 72 at all times that any emissions are vented to TREA 72. The Permittee shall document periods of non-operation of the control equipment TREA 72 whenever EQUIs 142 or 155 are operating. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 72	18686	The Permittee comply with the requirements of COMG 12 whenever emissions are vented to TREA 72. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
TREA 72	18687	Pressure Drop: Daily Recordkeeping. The Permittee shall record the time and date of each pressure drop reading and whether or not the recorded pressure drop was within the range specified in this permit. [Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 76	18686	The Permittee comply with the requirements of COMG 12 whenever emissions are vented to TREA 76. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 76	18687	Pressure Drop: Daily Recordkeeping. The Permittee shall record the time and date of each pressure drop reading and whether or not the recorded pressure drop was within the range specified in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 76	18700	The Permittee shall operate and maintain the Stage 1, Stage 2, and HEPA filter in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
TREA 76	18700	Daily Inspections: Once each operating day, the Permittee shall verify if the pressure drop reading is such that filter maintenance is required as per manufacturer's specifications. If maintenance is required, the permittee shall proceed to clean the unit as per manufacturer's specifications before the unit is placed on operation the next day. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TREA 76	18701	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the control equipment components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 76	18702	Corrective Actions: If the filters or any of their components are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan for the filter. The Permittee shall keep a record of the type and date of any corrective action taken for each filter. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 77	17611	The Permittee shall limit Stage 1 Filter Pressure Drop >= 0.0001 and <= 0.600 kilopascals, unless a new range is set pursuant to Minn. R. 7017.2025, subp. 3 based on the values recorded during the most recent MPCA-approved performance test where compliance was demonstrated. The new range shall be implemented upon receipt of the Notice of Compliance letter granting preliminary approval. The range is final upon issuance of a permit amendment incorporating the change. The Permittee shall record the pressure drop at least once every 24 hours. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]

SI Id	Sequence	Requirement
TREA 77	18671	The Permittee shall limit Stage 2 Filter Pressure Drop >= 0.0001 and <= 0.800 kilopascals, unless a new range is set pursuant to Minn. R. 7017.2025, subp. 3 based on the values recorded during the most recent MPCA-approved performance test where compliance was demonstrated. The new range shall be implemented upon receipt of the Notice of Compliance letter granting preliminary approval. The range is final upon issuance of a permit amendment incorporating the change. The Permittee shall record the pressure drop at least once every 24 hours. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 77	18680	The Permittee shall vent emissions from EQUIs 153 and 154 to TREA 77 whenever EQUIs 153 or 154 are operating, and operate and maintain TREA 77 at all times that any emissions are vented to TREA 77. The Permittee shall document periods of non-operation of the control equipment TREA 77 whenever EQUIs 153 or 154 are operating. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 77	18686	The Permittee comply with the requirements of COMG 12 whenever emissions are vented to TREA 77. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 77	18687	Pressure Drop: Daily Recordkeeping. The Permittee shall record the time and date of each pressure drop reading and whether or not the recorded pressure drop was within the range specified in this permit. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 77	18700	The Permittee shall operate and maintain the Stage 1, Stage 2, and HEPA filter in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
TREA 77	18700	Daily Inspections: Once each operating day, the Permittee shall verify if the pressure drop reading is such that filter maintenance is required as per manufacturer's specifications. If maintenance is required, the permittee shall proceed to clean the unit as per manufacturer's specifications before the unit is placed on operation the next day. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a)]
TREA 77	18701	Periodic Inspections: At least once per calendar quarter, or more frequently as required by the manufacturer's specifications, the Permittee shall inspect the control equipment components. The Permittee shall maintain a written record of these inspections. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 77	18702	Corrective Actions: If the filters or any of their components are found during the inspections to need repair, the Permittee shall take corrective action as soon as possible. Corrective actions shall include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the O & M Plan for the filter. The Permittee shall keep a record of the type and date of any corrective action taken for each filter. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 78	18220	The Permittee shall vent controlled emissions from EQUIs 130 and 131 as exhausted from TREA 65 to TREA 78 whenever EQUIs 130 or 131 operate, and operate and maintain TREA 78 at all times that any emissions are vented to TREA 78. The Permittee shall document periods of non-operation of TREA 78 whenever EQUIs 130 or 131 are operating. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 78	18230	The Permittee shall comply with the requirements of COMG 12 whenever emissions are vented to TREA 78. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 78	18240	The Permittee shall operate and maintain the electrostatic precipitator (ESP) in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
TREA 78	18260	Daily Monitoring: The Permittee shall physically verify the operation of the Continuous Parameter Monitoring System (CPMS) at least once each operating day to verify that it is working and recording properly. The Permittee shall maintain a written record of the daily verifications. [Minn. R. 7007.0800, subps. 4-5]

SI Id	Sequence	Requirement
TREA 78	18260	Data Collection: The Permittee shall maintain a continuous hard copy readout or computer disk file that shows the On/Off condition of the ESP at all times. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 78	18280	Quarterly Inspections: At least once per calendar quarter, or more frequently if required by the manufacturer, the Permittee shall inspect the control equipment components that are subject to wear or plugging, for example: bearings, belts, hoses, fans, nozzles, orifices, and ducts. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 78	18280	Monitoring Equipment: The Permittee must install and maintain a continuous parameter monitoring system (CPMS) for monitoring the ESP On/Off condition as required by this permit. The monitoring equipment must be installed, in use, and properly maintained, including maintaining the necessary parts for routine repairs of the monitoring equipment, whenever operation of the monitored control equipment is required. [Minn. R. 7007.0800, subps. 4-5]
TREA 78	18300	Annual Inspections: At least once per calendar year, or more frequently if required by the manufacturer, the Permittee shall inspect the control equipment components not covered by the quarterly inspections. This includes, but is not limited to, components that are not subject to wear or plugging including structural components, housings, and hoods. The Permittee shall maintain a written record of the inspection and any corrective actions taken resulting from the inspection. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 4, Minn. R. 7007.0800, subp. 5]
TREA 78	19600	Corrective Actions: The Permittee shall take corrective action as soon as possible if any of the following occur: - any recorded operating parameter is outside the required operating range (e.g., total power input); or - the ESP or any of its components are found during the inspections to need repair. Corrective actions shall return operation to within the permitted range and/or include completion of necessary repairs identified during the inspection, as applicable. Corrective actions include, but are not limited to, those outlined in the) O & M Plan for the ESP. The Permittee shall keep a record of the type and date of any corrective action taken for the ESP. [Minn. R. 7007.0800, subp. 14, Minn. R. 7007.0800, subp. 2(A), Minn. R. 7007.0800, subp. 5]
TREA 78	19631	Pre-Filter and Cell Maintenance: The Permittee shall transport pre-filters and cells in leak-proof containers during cleaning, replacement, or performing other maintenance. The Permittee shall dispose of all lead-soiled materials including, but not limited to, dishwasher waste water, mop heads, rags, personal protective equipment (PPE), vacuum bags, and any other material soiled or otherwise in contact with lead as hazardous waste. [Minn. R. 7007.0800, subp. 2, Minn. R. ch. 7045]
TREA 79	18220	The Permittee shall vent controlled emissions from EQUIs 134 and 135 as exhausted from TREA 67 to TREA 79 whenever EQUIs 134 or 135 operate, and operate and maintain TREA 79 at all times that any emissions are vented to TREA 79. The Permittee shall document periods of non-operation of TREA 79 whenever EQUIs 134 or 135 are operating. [Minn. R. 7007.0800, subp. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 79	18230	The Permittee shall comply with the requirements of COMG 12 whenever emissions are vented to TREA 79. [Minn. R. 7007.0800, subps. 2(A) & (B), Minn. R. 7009.0020-7009.0090, Minn. Stat. 116.07, subd. 4a(a), To avoid major source under 40 CFR 70.2 & Minn. R. 7007.0200]
TREA 79	18240	The Permittee shall operate and maintain the electrostatic precipitator (ESP) in accordance with the Operation and Maintenance (O & M) Plan. The Permittee shall keep copies of the O & M Plan available onsite for use by staff and MPCA staff. [Minn. R. 7007.0800, subp. 14]
TREA 79	18260	Daily Monitoring: The Permittee shall physically verify the operation of the Continuous Parameter Monitoring System (CPMS) at least once each operating day to verify that it is working and recording properly. RE: Administrative Order
Water Gremlin Co, White Bear Township, Ramsey County

Dear Mr. Junya Inoue:

The enclosed Administrative Order (Order) is being issued by the Minnesota Pollution Control Agency (MPCA) to Water Gremlin Company.

The Order requires Water Gremlin Company to complete the specified actions listed in the Order by specified dates.

Please contact Jennifer Carlson at 651-757-2538 or at Jennifer.M.Carlson@state.mn.us, if you have any questions regarding this Order.

Sincerely,

Jeff J

STATE OF MINNESOTA

Minnesota Pollution Control Agency

In the Matter of: ADMINISTRATIVE ORDER

Water Gremlin Company

This Administrative Order (Order) is issued by the Minnesota Pollution Control Agency (MPCA) to Water Gremlin Company (Water Gremlin) pursuant to Minn. Stat. § 116.07, subd. 9, and Minn. Stat. § 115.071, subd. 1.

FINDINGS OF FACTS

1. Water Gremlin is a domestic corporation that operates a lead metal fabrication facility (Facility) located at 4400 Otter Lake Road, White Bear Township, Ramsey County, Minnesota.
2. On August 22, 2019, the MPCA issued an Administrative Order (the August 22, 2019 Order) to Water Gremlin.
3. The August 22, 2019 Order required Water Gremlin to immediately cease all VOC coating operations, and to submit written documentation that it had done so. Water Gremlin confirmed in writing that it ceased operating its coaters upon receiving the Order that same day.
4. The August 22, 2019 Order prohibited Water Gremlin from operating VOC coating operations until corrective measures to prevent additional tDCE emissions from migrating from the coating rooms to the soil vapor beneath the Facility had been approved by the MPCA, completed, and determined to be effective.
5. On August 22, 2019, Water Gremlin proposed some corrective measures, such as lowering the vents inside the VOC coater enclosures to better capture the heavier-than-air tDCE emissions, converting some VOC coaters to water based coating, removing some VOC coaters from its Facility, sealing the coating room floors, and installing floor pans beneath the VOC coaters.
6. On August 27, 2019, Water Gremlin provided a diagram of stainless steel floor pans that it proposed to install beneath the VOC coaters at its Facility. Water Gremlin stated that the floor pans would eliminate the exposure of the concrete floor beneath the VOC coaters to tDCE vapors.
7. On August 27, 2019, MPCA staff visited the Facility. The MPCA confirmed that Water Gremlin had completed the proposed lowering of the air vents inside the VOC coater enclosures toward the floor, and constructed an additional lowered air vent in the middle of the main coating room. The MPCA also confirmed that Water Gremlin was not operating the VOC coaters, and was only operating the water-based coaters. Water Gremlin also stated during this inspection that it would like to convert more of the VOC coaters to water based coaters.
8. On August 30, 2019, the MPCA sent a letter stating that Water Gremlin's proposed corrective measures did not contain enough information for the MPCA to evaluate the proposed corrective measures and requested a Work Plan that included additional information.

9. The MPCA also required Water Gremlin to conduct additional soil vapor sampling near its property line, in order to determine if tDCE in the soil vapor was migrating off-site at a concentration above 33 times (33X) the residential intrusion screening values (ISVs). Concentrations above this value would require Water Gremlin to further define the vapor intrusion area of concern (concentrations above 33X residential ISVs) offsite into the residential neighborhood.
10. Water Gremlin completed the property line soil vapor sampling on August 28, 2019, and the MPCA received the analytical results of the soil vapor samples on August 29, 2019. No VOCs were detected above 33X residential ISVs in the soil vapor samples collected at the property line. Therefore, further definition of the vapor intrusion area of concern beyond the Water Gremlin property line to the west, north, and northeast, is not required at this time.
11. On August 31, 2019, Water Gremlin sent a letter stating that it installed and was operating a vapor mitigation system to address the vapor intrusion risk identified in the soil vapor beneath the building, and that it was capable of capturing tDCE emissions that might migrate from the VOC coating operations to the soil vapor beneath the Facility. Water Gremlin's environmental consultant, Wenck, also installed a carbon filtration system on the mitigation system air discharge to treat the soil vapors prior to discharging them. Wenck provides monitoring data to the MPCA on an MPCA-approved schedule.
12. On September 4, 2019, MPCA staff accompanied Minnesota Department of Health (MDH) staff to the Facility in order to conduct a visual inspection of the stainless steel floor pans and verify that VOC coating operations were not occurring.
13. During this visit, MPCA staff identified an accumulation of reddish material on the concrete floor beneath a VOC coater. Later that same day, the MPCA notified Water Gremlin that it must immediately contain and recover all of the spilled material under the VOC coating equipment, notify the Minnesota Duty Officer of the spill, notify the MPCA when this was completed, and document how the spilled material was managed.
14. On September 5, 2019, Water Gremlin notified the MPCA that it was cleaning up the spill, and that it was an accumulation of dried resins resulting from operation and maintenance over a long period, perhaps 15 years, and that it would be disposed of as hazardous waste. The MPCA required Water Gremlin to investigate if similar spills had occurred beneath other coaters, and to submit photographs of the spills before, and after cleanup.
15. On September 6, 2019, MPCA staff attended a Ramsey County hazardous waste inspection of the Facility. During this inspection, it was confirmed that Water Gremlin had cleaned up the spill material beneath several VOC coaters and was in the process of re-painting the floors beneath those coaters. During this inspection, it was discovered that the VOC solvent distiller in the chemical storage room had TCE and tDCE solvent liquid in the spill pan. Additionally, the solid hazardous waste barrel compactor had residual dried TCE and tDCE solvent material on the floor. Water Gremlin stated that historic VOC solvent spills have occurred utilizing its procedure to fill and empty the VOC distillation unit.
16. On September 9, 2019, Water Gremlin supplied photographic documentation of the clean-up and confirmed that seven VOC coaters had TCE and tDCE contaminated coating material spilled onto the concrete floor beneath the coaters.
17. That same day, Water Gremlin notified the MPCA that it began installing the stainless steel floor pans beneath VOC coaters at its Facility.

18. Also that same day, Water Gremlin submitted a proposed Work Plan, subject to MPCA approval, outlining proposed and completed corrective measures.

19. On September 12, 2019, MPCA staff attended a follow-up Ramsey County hazardous waste inspection at the Facility. This inspection related to, among other things, the spills under the VOC coaters and engineering problems that led to spills of hazardous waste in the coating rooms and chemical storage rooms. During the course of this meeting, Water Gremlin informed MPCA that the main coating room doors had been removed so that mitigation equipment could enter the Facility, and that the negative pressure alarm system was not alerting as expected. Water Gremlin is required under its current air permit to maintain the coating rooms under negative pressure, to ensure that all VOC emissions are routed to the control equipment. If the room was to become positively pressurized, an alarm would sound and Water Gremlin would have to correct whatever caused the positive pressure. Water Gremlin stated that the negative pressure alarm only sounded twice when the main coating room doors were removed. This means, Water Gremlin explained, that even with the doors removed, the main coating room maintains negative pressure, and opening and closing the doors on a regular basis does not cause the room to become positively pressurized.

20. After reviewing the Work Plan and visiting the Facility, the MPCA determined that Water Gremlin's proposed corrective measures were inadequate and immediately began drafting corrective measures that would be required if VOC coating operations were allowed to resume.

21. On October 7, 2019, seven additional sub-slab samples were collected from the main coating room. The mitigation system had been running for 37 days and tDCE had not been used at the Facility since August 22, 2019. Concentrations of tDCE in six of the sub-slab samples were above the industrial ISV and one of the sub-slap samples was above the 33X industrial ISV. The presence of tDCE in these samples at these elevated levels after 37 days of mitigation, and no active use of tDCE material at the Facility, is indicative of an ongoing source of tDCE in the subsurface.

22. The MPCA has also received the analytical results from the ongoing vapor mitigation system discharge monitoring. The analytical results indicate that the carbon filters are treating the majority of both TCE and tDCE emissions prior to being discharged to the atmosphere. All VOC emissions at the Facility, including VOC emissions from the vapor mitigation system, will be evaluated as part of the air toxics analysis that is part of the review of Water Gremlin's the air permit application.

23. On October 15, 2019, the MPCA received groundwater and soil sampling results for the samples collected beneath the Facility on October 4 and 7, 2019. These results demonstrate that both TCE and tDCE have contaminated the groundwater and soil beneath the Facility. The detections of tDCE in the soil and groundwater beneath the main coating room are indicative of a direct release of tDCE to the subsurface.

24. On September 25, 2019, and October 3, 2019, Water Gremlin conducted total enclosure testing on its three coating rooms in order to determine if its current ventilation system is adequate at maintaining negative air pressure, to ensure that all of the VOC emissions generated from VOC-coating operations will be captured and routed to the control equipment. MPCA staff witnessed the testing.

25. On October 8, 2019, Water Gremlin submitted the test report. After reviewing the report the MPCA requested additional information and on October 10, 2019, Water Gremlin submitted a revised report.

26. On October 30, 2019, the MPCA issued a Notice of Permanent Total Enclosure Verification Acceptance, stating that after review the three coating rooms passed the permanent total enclosure test.

27. On October 21, 2019, MPCA staff conducted an inspection at the Facility and observed that the chemical storage room and main coating room floors had been sealed, and that the stainless steel floor pans beneath the coaters in the main coating room had been sealed to the floor along the horizontal seam. During this inspection MPCA staff also observed two areas on the sealed floor where the sealant had flaked away, revealing the concrete floor beneath it. Water Gremlin stated that this had occurred due to a heavy piece of equipment falling onto the floor anrJ that it was exploring nptinn.s tn repair it.

28. On October 25, 2019, Water Gremlin submitted an analytical report for the water-based coating material. After review, the MPCA determined that the water-based coating material did not contain any VOCs above the detection level.

29. On November 7, 2019, MPCA staff conducted a follow-up inspection at the Facility and observed that the other two coating room floors had been sealed, and that the stainless steel floor pans beneath the coaters had been sealed to the floor along the horizontal seam. During this inspection, MPCA staff visually inspected the floors of all three coating rooms, and did not observe any degradation of the floor sealant. Water Gremlin stated that the previous areas of degradation had been professionally patched. MPCA staff also visually inspected each coater to determine if the coater was enclosed on all sides. MPCA staff documented coaters that still utilized the concrete wall as part of the coater enclosure. Water Gremlin stated that they were still in the process of constructing these additional enclosure walls.

30. On January 3, 2020, Water Gremlin notified the MPCA that it is no longer pursuing the use of the adsorber air pollution control equipment. Water Gremlin stated that it believes that it has exhausted any potential modifications or repairs and would result in recovery of the VOC solvent. As part of this change the bypass stacks will also be removed, the structure of the fluidized bed solvent recovery unit will remain in place but the adsorbing beads will be removed to minimize the pressure drop across the unit and reduce energy usage. Water Gremlin will verify that exit temperatures and flow rates are unchanged, or advise of new values, using the stack testing reference methods. Water Gremlin will submit a revised air permit application to incorporate these changes.

31. Water Gremlin will prepare and submit in January a revised air permit application to incorporate this change and to remove any references to the fluidized bed solvent recovery unit. The application will request a limit of 90 tons/year for VOC, without operation of the fluidized bed solvent recovery unit. That will be accomplished by restricting VOC usage to meet the 90 tons/year VOC limit without depending on any control equipment.

32. If at any time the MPCA determines that VOC coating operations are causing releases to the soil vapor, soil, or groundwater at the Facility, the MPCA reserves the right to prohibit Water Gremlin from continuing its VOC coating operations.

CONCLUSIONS

33. The MPCA has reviewed all available evidence, and has determined that given the location of the spills, in conjunction with the operation of the negative pressure alarm, the most likely cause of the contaminated soil vapor, soil, and groundwater beneath the Facility was indeed the TCE/tDCE spill material that was discovered beneath several VOC coating machines in September 2019, as well as past TCE/tDCE spills in the chemical storage room.
34. Water Gremlin's proposed corrective measures in the Work Plan were not sufficient to prevent additional contamination of the soil vapor, soil, and groundwater beneath the Facility.
35. The MPCA concludes that if Water Gremlin implements the corrective measures listed below in paragraphs 36-65, including measurements to confirm their effectiveness, as well as abide by all other environmental regulations, including hazardous waste regulations, additional contamination of the soil vapor, soil, and groundwater beneath the Facility will be unlikely.

ORDER

The MPCA will allow the Regulated Party to resume VOC coating operations subject to the following conditions. Failure to meet any of the conditions below will require Water Gremlin to cease VOC coating operations until approval by the MPCA.

Sealing the Floors with the Retro-Coat Vapor Intrusion Coating System

36. Prior to resuming any VOC coating operations, Water Gremlin shall seal the floors of all three coating rooms and the chemical storage room with the Retro-Coat Vapor Intrusion Coating System. The entire floor around the coaters, of each coating room, shall be sealed, with the seams of the stainless steel floor pans sealed to the floor with 3M Scotch-Weld Epoxy Adhesive DP100 Plus. This shall be verified and approved by MPCA staff prior to resuming VOC coating operations.

...THIS REQUIREMENT HAS BEEN COMPLETED.

37. Once each VOC coating operating day, Water Gremlin shall inspect the floor of each coating room to check for degradation of the Retro-Coat Vapor Intrusion Coating System.
    a. If degradation is discovered, Water Gremlin shall immediately resolve the degradation.
    b. If Water Gremlin does not resolve the degradation within 24 hours, Water Gremlin shall immediately cease VOC coating operations in that coating room until the degradation is corrected.
    c. Water Gremlin shall notify the MPCA immediately upon ceasing VOC coating operations due to degradation of the Retro-Coat Vapor Intrusion Coating System.
    d. Water Gremlin shall photograph all degradation areas before and after corrective actions are taken.
38. Water Gremlin shall keep a record of the daily floor inspection, as well as all degradation that is discovered, and all corrective actions taken. Water Gremlin shall submit these records to the MPCA daily, by 4:30 pm every operating day.

Paired Sub-Slab and Indoor Air Testing to Evaluate VOC Releases through the Floor-Slab

39. Prior to resuming any VOC coating operations, Water Gremlin shall conduct paired sub-slab and indoor air testing to establish baseline sub-slab VOC concentrations in the sub-surface in each VOC coating room and chemical storage room. MPCA will use the baseline sub-slab VOC concentrations to compare with future results once VOC coating has resumed to evaluate if VOCs are migrating from the indoor air to the sub-surface through the concrete floor.

    e. Submit a plan, subject to MPCA approval, detailing how and where the paired indoor air and sub-slab samples will be taken, the locations of each coater and chemical storage room, the laboratory that will analyze the samples, and the quickest TAT allowed by the laboratory. Upon MPCA approval of the plan the Regulated Party shall follow the approved plan.

    f. All existing sub-slab locations, or MPCA-approved relocated sub-slab sample locations, in each coating room and chemical storage room, shall be sampled along with paired indoor samples at each sub-slab location and an outdoor air sample. The outdoor air sample shall be taken west of the main coating room.

    g. The paired indoor air and sub-slab samples shall be collected and analyzed in accordance with the MPCA's Remediation Program's Best Management Practices (https://www.pca.state.mn.us/waste/vapor—intrusion-best-management-practices-0). Pressure differential measurements using a calibrated micro manometer shall be collected and reported to the MPCA at each sub-slab sample location during all sampling events.

    h. All indoor air, sub-slab, and outdoor air samples shall be collected in canisters that have been individually certified clean by the laboratory and analyzed for VOCs using EPA method TO-15 (MN List).

    i. The paired indoor air and sub-slab sample results shall be sent to the MPCA directly from the laboratory along with associated pressure differential readings as soon as possible following analysis.

40. The MPCA has grouped the VOC coaters and sub-slab points as follows. If the listed sub-slab sampling points no longer exist, new sub-slab sampling points will need to be installed within immediate proximity of the associated coaters within each coating group. All new sub-slab locations must be submitted to the MPCA for review and approval prior to sample collection. Water Gremlin is prohibited from moving these coaters, prior to receiving written approval from the MPCA. Water Gremlin is prohibited from operating VOC coaters that are not in these groups, prior to receiving written approval from the MPCA. Upon receiving written approval from the MPCA, all of the requirements in this Order apply to those VOC coaters:

    j. VOC Coater Group 1 (CG-1)
        i. Coater 25 (CTR-25)
        ii. Coater 28 (CTR-28)
        iii. Sub-slab point 11 (SS-11)

    k. VOC Coater Group 2 (CG-2)
        i. Coater 12 (CTR-12)
        ii. Coater 17 (CTR-17)

iii. Sub-slab point 12 (SS-12)

l. VOC Coater Group 3 (CG-3)
   i. Coater 21 (CTR-21)
   ii. Coater 22 (CTR-22)
   iii. SS-12
   iv. Sub-slab point 13 (SS-13)

m. VOC Coater Group 4 (CG-4)
   i. Coater 16 (CTR-16)
   ii. Coater 18 (CTR-18)
   iii. Coater 19 (CTR-19)
   iv. Coater 20 (CTR-20)
   v. Sub-slab point 14 (SS-14)

n. VOC Coater Group 5 (CG-5)
   i. Coater 9 (CTR-9)
   ii. Coater 10 (CTR-10)
   iii. Coater 15 (CTR-15)
   iv. Sub-slab point 15 (SS-15)

o. VOC Coater Group 6 (CG-6)
   i. Coater 8 (CTR-8)
   ii. Coater 23 (CTR-23)
   iii. Coater 24 (CTR-24)
   iv. Coater 26 (CTR-26)
   v. Sub-slab 19 (SS-19)
   vi. Sub-slab 20 (SS-20)

p. VOC Coater Group 7 (CG-7)
   i. Coater 4 (CTR-4)
   ii. Coater 27 (CTR-27)
   iii. Sub-slab 10 (SS-10)

41. Water Gremlin shall restrict VOC coating operations so that one VOC Coater Group is restarted at a time.

42. Within 12 hours of restarting any of the VOC coaters in a VOC Coater Group, for each of the VOC Coater Groups, Water Gremlin shall conduct paired indoor air and sub-slab sampling. Water Gremlin shall operate at least one VOC coater in each VOC Coater Group for a minimum of 6 hours prior to conducting the paired indoor air and sub-slab sampling. At least one VOC coater in the VOC Coater Group shall be operating during the paired indoor air and sub-slab sampling.

    q. All of the sub-slab locations associated with the VOC Coater Groups in operation shall be sampled along with paired indoor samples at the same sub-slab locations.

    r. The paired indoor air and sub-slab samples shall be taken in accordance with the MPCA's Remediation Program's Best Management Practices (https://www.pca.state.mn. us/waste/vapor-int rusion-best-manaReinent-practices-0). Pressure differential measurements using a calibrated micro manometer shall be collected and reported at each sub-slab sample location during all sampling events.

    5. The results of the paired indoor air and sub-slab sample analytical analysis shall be expedited as quickly as possible, with a turnaround time (TAT) as quickly the laboratory allows, not to exceed three days.

    t. The paired indoor air and sub-slab shall be analyzed for VOCs using EPA method TO-15 (MN List) and individually certified canisters.

    u. The paired indoor air and sub-slab sample results shall be sent to the MPCA directly from the laboratory along with associated pressure differential readings as soon as possible following analysis.

    v. MPCA will evaluate the laboratory analytical data in comparison to the baseline levels and pressure differential readings to determine if vapors are migrating through the floor slab and into the sub-surface.

    w. If MPCA determines that a significant release is occurring through the floor slab and into the sub-surface based on the data provided, MPCA will notify Water Gremlin to cease operating that VOC Coater Group. Upon receiving this notification, Water Gremlin shall immediately cease operating that VOC Coater Group, and notify the MPCA that it has done so.

        i. The MPCA will determine what, if any, actions Water Gremlin must take in order to re-start the affected VOC Coater Group, and will notify Water Gremlin in writing of these actions.

        ii. Water Gremlin is prohibited from restarting the affected VOC Coater Group until it has received written permission from the MPCA.

    x. Without waiting for notification from the MPCA, if at any time the indoor air samples exceed OSHA's Permissible Exposure Limits (PELs), Water Gremlin shall immediately cease all VOC coating operations in that coating room. Water Gremlin shall notify the MPCA that it has ceased operations in the affected coating room, and provide a report identifying the cause of the exceedance.

43. Water Gremlin shall not operate additional VOC Coater Groups until the paired sub-slab and indoor air sampling has been conducted for the currently operating VOC Coater Group.

44. Upon resuming any VOC Coating Groups, Water Gremlin shall conduct paired indoor air and sub-slab sampling every seven days, for the entire Facility.

y. All existing sub-slab locations in each coating room shall be sampled along with paired indoor samples at each sub-slab location.

z. The paired indoor air and sub-slab samples shall be taken in accordance with the MPCA's Remediation Program's Best Management Practices (https://www.pca.state.mn.us/waste/vapor-intrusion-best-management-practices-0). Pressure differential measurements using a calibrated micro manometer shall be collected and reported at each sub-slab sample location during all sampling events.

aa. The results of the paired indoor air and sub-slab sample analytical analysis shall be expedited as quickly as possible, with a turnaround time (TAT) as quickly the laboratory allows.

bb. The paired indoor air and sub-slab shall be analyzed for VOCs using EPA method TO-15 (MN List) and individually certified canisters.

cc. The paired indoor air and sub-slab sample results shall be sent to the MPCA directly from the laboratory along with associated pressure differential readings as soon as possible following analysis.

dd. MPCA will evaluate the laboratory analytical data in comparison to the baseline levels and pressure differential readings to determine if vapors are migrating through the floor slab and into the sub-surface.

ee. If MPCA determines that a significant release is occurring through the floor slab and into the sub-surface based on the data provided, MPCA will notify Water Gremlin to cease operating that VOC Coater Group. Upon receiving this notification, Water Gremlin shall immediately cease operating that VOC Coater Group, and notify the MPCA that it has done so.

i. The MPCA will determine what, if any, actions Water Gremlin must take in order to re-start the affected VOC Coater Group, and will notify Water Gremlin in writing of these actions.

ii. Water Gremlin is prohibited from restarting the affected VOC Coater Group until it has received written permission from the MPCA.

ff. Without waiting for notification from the MPCA, if at any time the indoor air samples exceed OSHA's Permissible Exposure Limits (PELs), Water Gremlin shall immediately cease VOC coating operations in that coating room. Water Gremlin shall notify the MPCA that it has ceased operations in the affected coating room, and provide a report identifying the cause of the exceedance.

Total Enclosure Test

45. Prior to resuming any VOC coating operations, Water Gremlin shall submit the permanent total enclosure test report that demonstrates that all of the coating rooms are indeed a permanent total enclosure.

...THIS REQUIREMENT HAS BEEN COMPLETED.

46. After resuming VOC coating operations, Water Gremlin shall observe and record the pressure drop, door status, and verify the alarm system is operating with a set point at a minimum pressure drop of 0.007 inches of water, for each coating room once each VOC coater operating day.

gg. If the pressure drop across any coating room door is less than 0.007 inches of water, Water Gremlin shall immediately take action to evaluate the reasons for the deviation, and correct the deviation.

hh. If the door status is different than the permanent total enclosure test report approved door status, for each coating room, Water Gremlin shall immediately take action to evaluate the reasons for the deviation, and correct the deviation.

ii. The current alarm system for each coating room door must be set to a minimum pressure drop of 0.007 inches of water.

jj. If the alarm system sounds, indicating that the pressure drop at a coating room door has fallen below 0.007 inches of water, Water Gremlin shall immediately cease operating all VOC coaters in the affected coating room. Water Gremlin shall immediately take action to evaluate the reason for the alarm system sounding, and correct the issue.

kk. Failure to operate within the MPCA-approved alarm system minimum pressure drop and door status violates this order and is sufficient basis for the MPCA to require Water Gremlin to cease VOC-coating operations in the affected coating room.

ll. If the pressure drop readings, or position of the coating room doors show any deviations that demonstrate that the coating rooms are not continuously operating as permanent total enclosures, Water Gremlin shall immediately notify the MPCA.

47. After resuming VOC coating operations, Water Gremlin shall submit a weekly report of the pressure drop readings, the door status, and daily alarm verification, for each coating room. The report must include any deviation from the approved minimum pressure drop, and/or door status, the actions taken to evaluate the reasons for the deviation, and the corrective actions taken to resolve the deviations.

mm. Water Gremlin shall submit the weekly report to the MPCA by 4:30 pm every Friday.

nn. If the MPCA determines that any of the deviations are significant, MPCA will notify Water Gremlin to cease all VOC coating operations in that affected coating room. Upon receiving this notification, Water Gremlin shall immediately cease all VOC coating operations in the affected coating room, and notify the MPCA that is has done so.

i. The MPCA will determine what, if any, actions Water Gremlin must take in order to re-start the affected VOC Coater Group, and will notify Water Gremlin in writing of these actions.

ii. Water Gremlin is prohibited from restarting the affected VOC Coater Group until it has received written permission from the MPCA.

<u>Gas Chromatograph Test on Water Based Coaters</u>

48. Within 14 days of resuming VOC coating operations, Water Gremlin shall analyze representative water-based coaters using gas chromatography to determine if there are any regulated pollutants being emitted from the water-based coating operations. The test shall not include material from VOC coaters and must include water-based coaters representing each of the various forms of coating application techniques (dipping, dripping, and spraying).

...THIS REQUIREMENT HAS BEEN COMPLETED.

49. Within 30 days of resuming VOC coating operations, Water Gremlin shall submit the results of the gas chromatograph analysis of the water-based coaters to the MPCA directly from the laboratory performing the analysis. The results must include a speciation of any VOCs identified in the water coating liquid.

VOC Emission Venting

50. Immediately upon resuming VOC coating operations, Water Gremlin shall vent all VOC emissions from the coating rooms to the carbon adsorber stack (STRU 3).

51. Immediately upon resuming VOC coating operations, Water Gremlin shall operate the ventilation system associated with the carbon adsorber stack (STRU 3) at all times that any VOC coating operations are operating. Water Gremlin is prohibited from exhausting VOC emissions from VOC coating operations through any other point.

VOC Coaters and Verification by MPCA

52. Each VOC coater must be inspected by the MPCA prior to it resuming VOC coating operations.

53. Each VOC coater must:

    oo. Either be a "table top" coater that does not touch the ground; or

    pp. Be fitted with a stainless steel floor pan; and

    qq. Be enclosed on all sides, so that concrete walls are not utilized as part of the coater enclosure, and the tops of the coaters are enclosed.

VOC 365-day Rolling Sum and Solvent Usage Records

54. Water Gremlin shall limit VOC emissions to less than or equal to 90 tons per year as a 365-day rolling sum.

55. On each day of operation, Water Gremlin shall calculate the VOC 365-day rolling sum.

    rr. This calculation shall be based on daily VOC solvent usage, which must include purchased solvent as well as VOC material that is shipped off-site as waste, and an MPCA approved allowance for VOC emission loss due to material handling, and VOCs contained in water based coatings.

    ss. If Water Gremlin wishes to get credit for VOC shipped off-site as waste, this must be done on a daily basis by measuring and recording the amount of VOC material shipped off-site as waste every day and subtracting this amount from the daily VOC usage records for the same day.

    tt. Water Gremlin shall include VOC emissions from coating operations, from the mitigation system, and from any other source at its Facility.

56. Water Gremlin shall submit daily VOC solvent usage records, daily water based coating usage records, daily VOC waste records, daily VOC emission loss records, and the VOC 365-day rolling sum, as an unlocked editable excel spreadsheet, to the MPCA by 4:30 pm each day following an operating day.

VOC Emission Monitor

57. Water Gremlin shall hire a third party company to operate a continuous VOC emission monitor at the carbon adsorber stack (STRU 3) anytime that VOC-coating operations are occurring.
58. The third party company shall submit the continuous VOC emission monitor results from STRU 3 daily to the MPCA, for the previous operating day.

VOC Ambient Monitoring

59. Water Gremlin shall continue to conduct VOC ambient monitoring every one in three days at the approved monitor locations, as outline in the March 1, 2019 Agreement.
60. Water Gremlin shall continue to maintain a 48 hour turnaround time (TAT) for the results of the VOC ambient monitoring analytical analysis.
    a. The VOC ambient monitoring results shall include the full TO-15 list.
    b. The VOC ambient monitoring results shall be sent to the MPCA as soon as possible after analysis and directly from the laboratory.

Modeling

61. Within 30 days of resuming VOC coating operations, Water Gremlin shall submit the requested information needed to conduct modeling of all emissions from its Facility, including all of the emissions from the mitigation stack.
    a. The MPCA will conduct the modeling, and will make decisions based on this information. If the MPCA determines that Water Gremlin requires additional operating restrictions, or other requirements, the Regulated Party must comply immediately.

Air Permit Application

62. On August 30, 2019, Water Gremlin submitted an air permit application supplement which included a proposed total enclosure test plan. This permit application supplement states that some coating units use spray application techniques for coating, however, the application supplement emissions calculations did not include a description of particulate emissions (such as rosin solids) from overspray. Within 30 days of resuming VOC coating operations, Water Gremlin shall submit a permit application supplement that includes a complete description of these spray-coating operations, including spray-coating emissions from both VOC and water-based coating operations.
    uu. If the water-based coating material is not applied by spraying the permit application supplement must specifically state so.
    vv. The air permit application supplement shall include emissions calculations describing the potential to emit for particulate matter (PM), particulate matter with an aerodynamic diameter less than 10 micrometers (PM10), and particulate matter with an aerodynamic diameter less than 2.5 micrometers (PM2.5), from all of the coaters.
63. Within 30 days of resuming VOC coating operations, Water Gremlin shall submit a permit application supplement that includes all of the adsorber and bypass stack changes that will or have occurred at its Facility. The application must include a detailed description of how the VOC and water-based solvent are handled at the facility at every step, from purchasing to disposal as a waste. It must include any onsite conditioning or reuse.

64. Water Gremlin is prohibited from implementing changes at the Facility, including modifying additional VOC coaters to water-based coaters, that have not been fully described in a supplement to the August 30, 2019 air permit amendment application that has been reviewed and accepted in writing by the MPCA. The MPCA will accept an air permit amendment application in writing if it is complete and if the technical questions have been answered in enough detail to draft all of the air permit conditions for the units affected by the changes.

Compliance With Applicable Laws and Obligations

65. Water Gremlin shall operate in compliance with all applicable federal, state, and local laws and regulations, including without limitation in Water Gremlin's undertaking actions to comply with this Order. Except when the MPCA has specifically authorized a different compliance method, Water Gremlin must also comply with all applicable permits, orders, stipulation agreements, and schedules of compliance.

NOW, THEREFORE, IT IS ORDERED:

RESERVATION OE AUTHORITY

Nothing in this Order shall prevent the MPCA from taking action to enforce the requirements of this Order, or from requiring additional action by the Regulated Party if necessary to ensure compliance with MPCA rules and statutes. In addition, the issuance of this Order is not an exclusive action or remedy by the MPCA, and it does not limit in any way the MPCA's authority to bring an enforcement action against or to seek and collect penalties from the Regulated Party. This Order is issued to require immediate action to correct violations, and it does not limit or preclude any other action, including the issuance of further orders, pursuit of injunctive or other relief, or commencement of enforcement actions and collection of penalties.

This Order is effective upon the date that it is signed by the MPCA Commissioner or designee.

IT IS SO ORDERED.

RETURN RECEIPT REQUESTED

Junya Inoue, President
Water Gremlin Company
4400 Otter Lake Rd
White Bear Township, MN 55110

RE: Executed Stipulation Agreement

Dear Mr. Junya Inoue:

Enclosed is your signed copy of the executed Stipulation Agreement (Agreement) that was signed by the Minnesota Pollution Control Agency (MPCA) Commissioner.

The date upon which the Agreement was executed by the Commissioner or his designee is the effective date of the Agreement.

Water Gremlin Company (Regulated Party) is reminded that the $4,500,000.00 portion of the civil penalty is due on the date listed in the enclosed invoice. Payment should be made by check payable to the Minnesota Pollution Control Agency, and mailed to MPCA, P.O. Box 64893, St. Paul, Minnesota, S5164-0893. To make an electronic péyment, contact MPCA Fiscal Services at 651-757-2182.

As indicated in the Agreement, communications between the Regulated Party and the MPCA concerning the terms and conditions of the Agreement shall be directed to the MPCA Case Contact, Jennifer Carlson, 651-757-2538 or Jennifer.m.carlson@state.mn.us. Communications related to the Supplemental Environmental Projects in the Agreement shall be directed to Sarah Kilgriff, 651-757-2492 or sarah.kileriff@state.mn.us

Thank you for your cooperation in this matter.

Sincerely,

Jennifer

STATE OF MINNESOTA

MINNESOTA POLLUTION CONTROL AGENCY

IN THE MATTER OF: Water Gremlin Company STIPULATION AGREEMENT

Part 1. RAR7/ES.

This Stipulation Agreement (Agreement) applies to and is binding upon the following parties:

a. Water Gremlin Company (Regulated Party); and

b. The Minnesota Pollution Control Agency (MPCA), which is authorized to enter into this Agreement under Minn. Stat. chs. 115 and 116.

Unless specified otherwise in this Agreement, where this Agreement identifies actions to be taken by the MPCA, the Commissioner or the Commissioner's designees shall act on the MPCA's behalf.

Part 2. ***PURROSE AND SCORE OF STIPULATION AGREEMENT.***

The purpose of this Agreement is to resolve the alleged violations set out in Part 6 of this Agreement by specifying actions the Regulated Party agrees to undertake. By entering into this Agreement, the Regulated Party is settling a disputed matter between itself and the MPCA and does not admit that the alleged violations set out in Part 6 of this Agreement occurred. However, the Regulated Party agrees that the MPCA may rely upon the alleged violations set out in Part 6 as provided in Part 13 of this Agreement. Except for the purposes of implementing and enforcing this Agreement, nothing in this Agreement constitutes an admission by any Party, or creates rights, substantive or procedural, that can be asserted or enforced with respect to any claim of or legal action brought by a person who is not a party to this Agreement. All citations are to the latest codification of the cited material unless otherwise indicated.

Part 3. ***AUTHORITY.***

This Agreement is entered under the authority vested in the MPCA by Minn. Stat. chs. 115 and 116.

Part 4. ***DEFINITIONS.***

Unless otherwise explicitly stated, the definitions in Minn. Stat. chs. 115, 115A, 1158, 115C, 116, 116B and in Minn. R. chs. 7000 to 7151 apply, as appropriate, to the terms used in this Agreement.

Part 5. ***BACKGROUND.***

The following is the background of this Agreement:

<u>The Regulated Party omits Hazardous Air Pollutants That Requires It To Obtain An Air Quality Permit</u>.

a. The Regulated Party is a domestic corporation and operates a lead metal fabrication facility located at 4400 Otter Lake Road, White Bear Township, Ramsey County, Minnesota 55110 (Facility). The Regulated Party's Facility fabricates products including fishing sinker weights and lead acid battery terminals. Until January 2019, the Regulated Party used a solvent, trichloroethylene (TCE), as part of its manufacturing process, and TCE was the largest Hazardous Air Pollutant (HAP) emitted from the Facility.

b. According to the United States Environmental Protection Agency (EPA), TCE exposure can raise a number of health effects, including effects in the developing fetus from both short term and long term exposure.

c. The Minnesota Department of Health (MDH) develops Health-Based Values(HBVs) using available toxicity guidance. HBVs are intentionally very protective and are used to set limits on facility emissions to protect the surrounding community. The current MDH-developed HBV for TCE is 2 micrograms per cubic meter.

d. Because TCE is designated as a volatile organic compound (VOC) and a HAP and can cause significant health effects, the Facility is subject to both state and federal regulations under Minn. R. 7007, et seq. and the Clean Air Act (CAA), 42 U.S.C. § 7401, et seq. Both state and federal law set emission thresholds for various pollutants, including VOC and HAP emissions, that trigger the neCd for an air quality operating permit. Minn. R.7007.0150-.0250; 42 U.S.C. § 7401, et seq. If a facility's potential to emit (PTE) of any regulated pollutant is greater than or equal to the federal Title V, Part 70 major source threshold, the facility will be considered a major source, need a Title V, Part 70 permit (Part 70 permit), and may be subject to operating requirements and regulations under the National Emission Standards for Hazardous Air Pollutants (NESHAP). 42 U.S.C. § 7661c; Minn. R. 7007.0200. For VOC, the federal Part 70 permit threshold is 100 tons per year, and for a single HAP, the federal Part 70 permit threshold is 10 tons per year; any facility emitting greater than or equal to these amounts must obtain a Part 70 permit.

e. To avoid the need to obtain a Part 70 permit and corresponding requirements, a facility may agree to enforceable operating conditions to limit its emissions. Limiting emissions in this manner is referred to as making a facility a "synthetic minor" and the permit is referred to as a "synthetic minor permit." Acceptable synthetic minor limits must include specific emission limits as well as operational or production limits to restrict emissions below the federal threshold. Minn. R.7007.0150-.0250.

f. The Regulated Party agreed to limit its emissions below the federal threshold and applied to the MPCA for a synthetic minor permit. Specifically, the Regulated Party agreed that emissions from all of its battery terminal post coating machines would be routed to a pollution control device, a catalytic oxidation system, which would control at least 95% of TCE emissions from the Regulated Party's coating process. Based on the information and assurances provided by the Regulated Party, the MPCA issued the Regulated Party a synthetic minor permit, air emissions permit No. 12300341-001 (Permit 001), on July 20, 2000.

<u>The Regulated Party Replaces Its Control Equipment, And The MPCA Issues New Permits In 2002 and 2006 Requiring The Regulated Party To Maintain Its Control Equipment at 9556 Efficiency.</u>

g. On July 19, 2001, the Regulated Party submitted to the MPCA an air permit application to replace its older control equipment, a catalytic oxidation system, with a new control equipment unit, a fluidized bed organics recovery system (CE003). The Regulated Party represented to the MPCA that the reason for the replacement was because the catalytic oxidation system was not working as planned. The Regulated Party also represented to the MPCA that the new CE003 would provide a minimum control of 95%, which would limit the Facility's single HAP emissions to less than 9.5 tons per year.

h. On September 25, 2001, the MPCA entered into a Schedule of Compliance (SOC) with the Regulated Party. The SOC allowed the Regulated Party to construct and operate CE003 prior to issuance of an air permit amendment. On December 31, 2002, the MPCA determined that the Regulated Party had completed all the requirements and terminated the SOC.

i. On March 18, 2002, the MPCA issued air emissions permit No. 12300341-002 (Permit 002) to the Regulated Party, which required a VOC and HAP performance test within 30 days of permit issuance to measure the control efficiency of CE003, required operation of CE003 at all times during which the associated emission units were in operation, and required a minimum 95% control efficiency of CE003 to achieve the minimum 95% reduction in VOC and HAP emissions.

j. On April 10, 2002, the Regulated Party conducted a VOC performance test on CE003, which demonstrated an average VOC removal efficiency of 98.9%. On June 12, 2002, the MPCA issued a Notice of Compliance (NOC) to the Regulated Party, which established a desorption temperature limit of greater than or equal to 250 degrees Fahrenheit, an inlet static pressure range of 2.0 to 4.5 inches of water column, and a carrier gas feed pressure of greater than or equal to 22 inches of water column, all to be measured as a 24-hour block average. Those operating parameters were incorporated into Permit 002, page A-8, as requirements, and monitoring and recordkeeping requirements were also added to ensure that the Regulated Party's compliance with those parameters was monitored and recorded.

k. Following the VOC performance test, the Regulated Party reported some issues with CE003 but represented that it had identified the root cause of the issues and had repaired and rebuilt CE003. For example, on May 6, 2002, the MPCA received a breakdown notification from the Regulated Party, stating that CE003 broke down for 11 hours due to shorted wires. On July 19, 2002, the MPCA received a breakdown notification from the Regulated Party, stating that CE003 broke down for 11 hours and 30 minutes due to an oil leak. On August 12, 2002, the MPCA received a breakdown notification from the Regulated Party, stating that CE003 broke down due to a clogged desorber. It is unknown how long CE003 was offline. On August 14, 2002, the MPCA received an email from the Regulated Party, stating that CE003 had a breach in the system allowing oil to penetrate the carbon and therefore rendering the unit inoperable, and that the desorber sections would be removed and repaired. The Regulated Party did not have an estimate when the repairs would be complete, but stated they would continue to update the MPCA.

l. On August 28, 2002, the Regulated Party sent the MPCA a letter from the manufacturer of CE003, which described the root cause analysis of the breakdowns to be due to significant internal condensation in the region between the top of the heated section tube sheet and the seal zone tube sheet. This caused areas of corrosion and erosion allowing an oil breach. The entire heated section needed to be replaced as well as the flange on the seal section, the tube sheet needed a re-design to minimize condensation, and the entire interior of the seal area and top of the heated section needed to be coated with PFA (perfluoroalkoxy copolymer resin). On February 14, 2003, the Regulated Party represented that CE003 had been rebuilt and was operational. The MPCA, therefore, did not require an additional VOC test.

m. On March 29, 2006, the Regulated Party submitted an air permit application to revise current permit requirements to allow more flexibility in changing market conditions, remove obsolete permit requirements, and include pre-approved future coaters to be installed without further MPCA authorization required.

n. On September 22, 2006, the MPCA issued air emissions permit No. 12300341-003 (Permit 003) to the Regulated Party. As with all the previous permits, Permit 003 requires that the Regulated Party comply with permit conditions related to VOC and HAP emissions, so that the Facility's emissions are limited and the Facility is not considered a major source under the Part 70 permit program. In order to limit VOC and HAP emissions, the Regulated Party is required to operate CE003 at all times during which the associated emission units are in operation, and maintain at least a 95%

control efficiency. The MPCA relied on the 2002 VOC performance test and the Regulated Party's maintenance and rebuilding as the justification for CE003's capability to operate above the required 95% control efficiency, and included operating and recordkeeping requirements for CE003 in Permit 003.

o. From July 2010 through December 2018, CE003 experienced multiple shutdowns and breakdowns. Throughout this same period, however, the Regulated Party continued to represent that it had resolved any issues with CE003 and never identified that CE003 was not achieving 95% efficiency as required under Permit 003. On July 23, 2018, the Regulated Party submitted a shutdown/breakdown notification stating that CE003 was being taken down, and that it was operating at a reduced rate of 6 coating machines during this shutdown period.

p. On January 7, 2004, February 13, 2012, and February 7, 2017, the MPCA conducted inspections at the Regulated Party's facility. Nothing was discovered during these inspections to indicate that CE003 was not achieving 95% control efficiency, or that the Regulated Party was emitting excess HAP and VOC emissions. The MPCA relies upon the Regulated Party's records and documentation to ensure compliance with permit conditions.

The Regulated Party Submits An Audit Report In 2018 And The MPCA Issues An Alleged Violation Letter Demanding Additional Information And Data Be Provided.

q. On July 30, 2018, the Regulated Party voluntarily submitted an Environmental Audit Program Report Inventory Submittal (Audit Report) to the MPCA, disclosing several violations of Permit 003.

r. On September 20, 2018, pursuant to the Regulated Party's request, the Regulated Party met with the MPCA to discuss the Audit Report. During the meeting, the Regulated Party stated that CE003 was shut down on July 22, 2018, coating production had been reduced, a new control equipment system was ordered and it would be approximately four months to construction of the new control equipment system, and that the Regulated Party would like to install the new control equipment system as soon as possible. At this meeting the Regulated Party was unable to produce records detailing whether or not CE003 was operating every day prior to July 22, 2018. Also during this meeting, the Regulated Party stated that it had continued to operate associated coating emission units since CE003 was shut down on July 22, 2018, at an unknown reduced rate, even though it understood that it was prohibited from doing so by Permit 003. The Regulated Party did not provide emissions calculations at this meeting and the MPCA demanded the Regulated Party provide additional information. On September 21, 2018, the Regulated Party emailed initial emissions calculations, however the Regulated Party did not identify to the MPCA how these calculations were conducted.

s. On October 23, 2018, the Regulated Party submitted a major air permit amendment application to the MPCA to replace CE003 with a new fluidized activated carbon bed.

t. On November 8, 2018, the MPCA issued the Regulated Party an Alleged Violations Letter (AVL).

u. On November 28, 2018 and December 7, 2018, the Regulated Party responded to the AVL. During review of these responses, the MPCA discovered that the Regulated Party had calculated the Facility's annual TCE emissions using a mass balance calculation since 2009. This calculation revealed that CE003 had not been maintaining 95P«control since at least that time, and that the Facility had emitted more than 100 tons of TCE for calendar year 2018 through November 20, 2018. The Regulated Party's emissions exceeded the federal threshold, qualified it as a major source, prohibited

the Regulated Party from operating without a Part 70 permit, and subjected the Regulated Party to the additional Part 70 requirements such as the Surface Coating of Miscellaneous Metal Parts and Products: NESHAP, Subpart MMMM (NESHAP MMMM). In its responses to the AVL, the Regulated Party also stated that it had worked to repair CE003 since its first malfunction in May 2018, that it would immediately begin evaluating replacement of CE003, that a root cause analysis was completed on CE003, that CE003 began operating again on December 3, 2018, and that new control equipment has been ordered. In its AVL response the Regulated Party did not include records detailing the amount of time CE003 was operating at less than 95% control efficiency, or the date four lead melt pots were constructed. The MPCA and Regulated Party continued discussion regarding the remaining requested records

v. Subsequently, on December 4 and 8, 2018, CE003 had additional system failures.

w. On December 20, 2018, the MPCA met with the Regulated Party to discuss its AVL responses, specifically the Regulated Party's failure to provide information the MPCA had requested. During this meeting, the Regulated Party represented that it would start compiling the previously requested information.

x. Following that meeting, the Regulated Party partially complied with the MPCA's previous records request, and produced some limited calculations and sales data to the MPCA on December 20 and December 26, 2018.

The Regulated Party Submits Data Requested By The MPCA, and The MPCA Requests The Regulated Party Immediately Shut Down Operations.

y. On January 11, 2019, the Regulated Party submitted an updated 12-month rolling average HAP/VOC spreadsheet. This spreadsheet shows an increase in HAP/VOC emissions from coating machine operation since July 2018, even though the Regulated Party had previously stated in the shutdown/breakdown notification submitted to the MPCA on July 23, 2018 that it had reduced coating operations to 6 coating machines, and represented again in the meeting on September 20, 2018 that it had reduced coating operations.

z. The Regulated Party also submitted the monthly emissions calculation for December 2018 required by the NESHAP MMMM, revealing that the Regulated Party exceeded permissible emission limits by 83.56 pounds organic HAP per gallon coating solid amount. The Regulated Party stated that it did not have the necessary records to calculate other monthly values required by the NESHAP MMMM, even though the Regulated Party knew by at least July 2018 that it was subject to this NESHAP requirement. In its air permit application submitted in October 2018, the Regulated Party indicated its intention to limit HAP emissions such that it would be a synthetic minor source under Part 70, and not subject to NESHAP MMMM

aa. On January 14, 2019, the MPCA held a teleconference with the Regulated Party to discuss voluntary cessation of the Facility's coating operations. The Regulated Party agreed and voluntarily ceased operations the same day.

The Regulated Party Agrees To Remove All TCE From Its Facility, To OnlY Use A HAP-Free Solvent, And To Install New Control Equipment.

bb. In January and February 2019, the MPCA and the Regulated Party met numerous times to determine what, if any, safe coating operating scenario exists prior to installation of new control equipment and have conducted modeling to determine the impact TCE emissions may have had on the local community.

cc. On January 23, 2019, the Regulated Party notified the MPCA that it was voluntarily committing to temporarily resume coating operations with a different solvent that does not contain a HAP, called FluoSolv. The primary component of FluoSolv is trans-1,2-dichloroethylene (trans-1,2-DCE), which has a VOC content of 88%. After receiving this information, the MPCA contacted MDH to discuss the new solvent.

dd. On January 30, 2019, MDH sent the MPCA a site-specific risk assessment advice (RAA), stating that MDH has determined a chronic RAA number for trans-1,2-DCE of 70 micrograms per cubic meter. MDH informed the MPCA that no shorter-term guidance is available at this time. After receiving this information from MDH, the MPCA conducted additional modeling to determine if, and at what level, the Regulated Party would be able to resume coating operations utilizing FluoSolv without adversely impacting human health and the environment.

ee. On February 4, 2019, the Regulated Party sent an email to the MPCA stating that it was voluntarily committing to permanently discontinue the use of TCE in its coating operations, and would amend its air permit amendment application to limit solvent usage to a HAP-free solvent.

ff. On February 6, 2019, the Regulated Party confirmed that it had voluntarily removed all remaining TCE solvent from the Facility.

gg. On February 8, 2019, the Regulated Party submitted an updated air permit amendment application to the MPCA, which included emission calculations only from the FluoSolv solvent.

hh. On February 13, 2019, the Regulated Party submitted TCE purchase, waste, and estimated emission records from 2002 to 2008. This submittal did not include TCE re-use records.

Part 6. ***ALLEGED VIOLATIONS.***

The MPCA alleges that the Regulated Party has violated the following requirements of statute, rule, and/or permit condition:

1. AIR EMISSIONS PERMIT NO. 12300341-003, TABLE A: LIMITS AND OTHER REQUIREMENTS, GP001 BATTERY TERMINAL COATERS WITH REWORK TABLES AND ASSOCIATED CONTROL EQUIPMENT, PAGE A-4

   The emission units designated as Future Coater in GP 001 may be installed at any time without prior authorization of or review by the MPCA. Any newly installed emission unit will be subject to all GP001 requirements.

   At such time that any emission unit(s) designated as Future Coater in GP 001 is installed, the owner or operator shall notify the MPCA in the next emissions inventory submittal. Such notification shall constitute all reporting required in connection with installation of the emission unit(s).

   Minn. R. 7019.3020 CALCULATION OF ACTUAL EMISSIONS FOR EMISSION INVENTORY

   A. Emissions from all emissions units shall be reported in the annual emissions inventory report in a format specified by the commissioner. Emissions from insignificant activities listed in part 7007.1300, subpart 2, shall not be reported. Emissions from insignificant activities listed in part 7007.1300, subparts 3 and 4, and conditionally insignificant activities listed in part 7008.4000 shall be reported if the commissioner or owner or operator has determined that emissions from those activities are not insignificant for purposes of permitting under parts 7007.0100 to 7007.1850 or for those activities required to be quantified by a facility issued a capped permit option 1. Notwithstanding the previous sentence, the commissioner may request an inventory of

fugitive emissions from roads and parking lots, defined as insignificant under part 7007.1300, subpart 3, item J, upon determining that emissions from these sources represent a substantial portion of the facility's total emissions.

The Regulated Party replaced three coaters (EU027, EU028, and EU029), and emitted HAP and VOC emissions from four lead melt pots (EU023, EU024, EU025, and EU026) without reporting such activities in past Emission Inventory Reports.

The Regulated Party estimates that EU023, EU024, EU025, and EU026 were constructed in 1991 and have never been reported in any Emissions Inventory Report. The Regulated Party acknowledged in the Audit Report that it failed to report these replaced coaters or emissions from the lead pots in any past Emission Inventory Reports submitted to the MPCA. These have since been determined to be insignificant activities and identified in the Major Amendment application submitted February 8, 2018.

The Regulated Party has also under-reported HAP and VOC emissions from its Facility since at least 2002. MPCA calculations estimate approximately 759 tons of HAP and VOC emissions have not been reported since 2002 as detailed in the table below:

Year	Actual HAP/VOC Emissions (tpy)	HAP/VOC Emissions Reported to MPCA (tpy)	HAP/VOC Emissions Not Reported (tpy)
2002	65.1	44.5	20.61
2003	50.60	9.89	40.71
2004	28.81	4.24	24.57
2005	36.95	6.99	29.96
2006	49.45	5.46	43.99
2007	70.92	5.16	65.76
2008	40.77	4.98	35.79
2009	32.89	4.96	27.93
2010	51.08	5.77	45.31
2011	71.10	4.76	66.34
2012	62.26	4.74	57.52
2013	87.78	8.75	79.03
2014	81.07	5.39	75.68
2015	80.10	5.72	74.38
2016	76.87	5.11	71.76
Total HAP/VOC Emissions Not Reported (tons since 2002)			759.32

2. AIR EMISSIONS PERMIT NO. 12300341-003, TABLE A: LIMITS AND OTHER REQUIREMENTS, TOTAL FACILITY, PAGE A-1; CE003 FLUIDIZED ACTIVATED CARBON BED, PAGE A-9

   Air Pollution Control Equipment: Operate all pollution control equipment whenever the corresponding process equipment and emission units are operated, unless otherwise noted in Table A.

   Operation Changes: In any shutdown, breakdown, or deviation the Permittee shall immediately take all practical steps to modify operations to reduce the emission of any regulated air permit. The Commissioner may require feasible and practical modifications in the operation to reduce emissions of air pollutants. No emissions units that have an unreasonable shutdown or breakdown frequency of process or control equipment shall be permitted to operate.

   Operate a bead activated carbon adsorb/desorb/condenser emission control system at all times during which the associated emission units are in operation. Operation of the emission control

   system for HAP and Volatile Organic Compounds: greater than or equal to 95% control efficiency.

   Minn. R. 7019.1000 NOTIFICATIONS OF DEVIATIONS WHICH ENDANGER HUMAN HEALTH OR THE ENVIRONMENT; SHUTDOWNS AND BREAKDOWNS

   Subp. 4. Operation changes. In any shutdown, breakdown, or deviation covered by subpart 1, 2, or 3, the owner or operator shall immediately take all practical steps to modify operations to reduce the emission of any regulated air pollutant. The commissioner may require feasible and practical modifications in the operation to reduce emissions of air pollutants. No emissions units that have an unreasonable shutdown or breakdown frequency of process or control equipment shall be permitted to operate.

The Regulated Party has failed to operate CE003 at a minimum of 95% control efficiency since at least 2002. The Regulated Party has stated that accurate records to demonstrate CE003 operated at its required minimum 95% control efficiency do not exist.

On July 22, 2018 the Regulated Party shutdown CE003; however, it continued to operate the corresponding process equipment without operating CE003, except for a few days in December 2018, until voluntary shutdown of the process equipment on January 14, 2019.

3. AIR EMISSIONS PERMIT NO. 12300341-003, TABLE B: RECURRENT SUBMITTALS, PAGE B-2

   Semiannual Deviations Report: Due 30 days after end of each calendar half-year starting 07/20/2000. The first semiannual report submitted by the Permittee shall cover the calendar half-year in which the permit is issued. The first report of each calendar year covers January 1—June 30. The second report of each calendar year covers July 1—December 31. If no deviations occur, the Permittee shall submit a report stating that no deviations occurred during the reporting period.

   Compliance Certification: Due 31 days after end of each calendar year starting 07/20/2000 (for the previous calendar year). To be submitted to the Commissioner on a form approved by the Commissioner. This report covers all deviations experienced during the calendar year.

The Regulated Party failed to report excess HAP emissions in past semiannual deviations reports and annual compliance certifications from at least 2002 through 2017.

4. Minn. R. 7007.0150 PERMIT REQUIRED.
   Subpart 1. Prohibition.

   A. No person may construct, modify, reconstruct, or operate an emissions unit, emission facility, or stationary source until plans for it have been submitted to the agency and a written permit for it has been granted by the agency. Exceptions to the requirement to obtain a permit are located in part 7007.0300. Exceptions to the requirement to obtain a permit amendment are located in parts 7007.1250 and 7007.1350.

   Minn. R. 7007.0200 SOURCES REQUIRED OR ALLOWED TO OBTAIN A PART 70 PERMIT.

   Subpart 1. Part 70 permit required. The owners and operators of any emission facilities, emission units, and stationary sources described in subparts 2 to 5 must obtain a part 70 permit from the agency. All provisions of parts 7007.0100 to 7007.1850 apply to part 70 permits unless the provision states that it applies only to state permits, registration permits, capped permits, or general permits. If the owners and operators of a stationary source are required to obtain a part 70 permit by subpart 2, item B or C, the owners and operators shall also separately determine under subpart 2, item A, if the stationary source is a major source subject to major source requirements under section 112 of the act.

   Subp. 2. Major sources. Any "major source," which means any stationary source that is described in item A, B, or C, must obtain a permit under this part.

   A. A major source under section 112 of the act (Hazardous Air Pollutants), which is defined as:

   (1) For pollutants other than radionuclides, any stationary source that emits or has the potential to emit, in the aggregate, ten tons per year or more of any hazardous air pollutant which has been listed pursuant to section 112(b) of the act, 25 tons per year or more of any combination of such hazardous air pollutants, or such lesser quantity as the administrator may establish by rule.

   B. A major stationary source of air pollutants, as defined in section 302 of the act (General Provisions; Definitions), that directly emits or has the potential to emit, 100 tons per year or more of any air pollutant (including any major source of fugitive emissions of any such pollutant, as determined by rule by the administrator) and, effective July 1, 2011, 100,000 tons per year CO_2e of greenhouse gases. The fugitive emissions of a stationary source shall not be considered in determining whether it is a major stationary source for the purposes of section 302(j) of the act, unless the stationary source belongs to one of the following categories of stationary sources.

The Regulated Party has been a major source since at least 2002, when HAP emissions exceeded ten tons per year. The Regulated Party knew this by at least June 28, 2018, when an Audit was conducted, however the Regulated Party has not submitted an air emissions permit application for a Part 70 permit, and in fact continued to operate the Facility so that HAP and VOC emissions for 2018 exceeded 100 tons per year. The following table demonstrated HAP and VOC emissions since 2009.

Year	Actual HAP/VOC Emissions (tpy)	Part 70 HAP Limit (tpy)	Emissions Exceeding Part 70 HAP Limit (tpy)	Percentage Over Part70 HAP Limit (%)	Part 70 VOC Limit (tpy)	Emissions Exceeding Part 7- VOC Limit (tpy)	Percentage Over Part70 VOC Limit (#»)
2002	65.11	10	55.11	551.1	100	0	0
2003	50.60	10	40.60	406.0	100	0	0
2004	28.81	10	18.81	188.1	100	0	0
2005	36.95	10	26.95	269.5	100	0	0
2006	49.45	10	39.45	394.5	100	0	0
2007	70.92	10	60.92	609.2	100	0	0
2008	40.77	10	30.77	307.7	100	0	0
2009	32.89	10	22.89	228.9	100	*0*	0
2010	51.08	10	41.08	410.8	100	0	0

2016	76.87	10	66.87	668.7	100	0	0
2017	73.02	10	63.02	630.2	100	0	0
2018	120.456	10	**110.456**	**1104.56**	100	20.456	20.456

In October 2018 and February 2019 the Regulated Party submitted air permit applications stating that it intends to limit HAP and VOC emissions to once again become a synthetic minor source.

5. Minn. R. 7007.0150 PERMIT REQUIRED.
   Subpart 1. Prohibition.

   A. No person may construct, modify, reconstruct, or operate an emissions unit, emission facility, or stationary source until plans for it have been submitted to the agency and a written permit for it has been granted by the agency. Exceptions to the requirement to obtain a permit are located in part 7007.0300. Exceptions to the requirement to obtain a permit amendment are located in parts 7007.1250 and 7007.1350.

The Regulated Party constructed two space heaters (EQUI191 and EQUI192) at the Facility prior to issuance of an air permit that included these emissions units. The Regulated Party estimates that EQUI191 was constructed in 2016, and EQUI192 was constructed in 2015.

6. Minn. R. 7000.0300 DUTY OF CANDOR

   In all formal or informal negotiations, communications, proceedings, and other dealings between any person and any member, employee, or agent of the board or commissioner, it shall be the duty of each person and each member, employee, or agent of the board or commissioner to act in good faith and with complete truthfulness, accuracy, disclosure, and candor.

On September 20, 2018, the Regulated Party stated that it had reduced coating operations since shutting down CE003 on July 22, 2018. However, emissions data shows an increase in HAP and VOC emissions since that time period, especially increasing after the MPCA met with the Regulated Party on September 20, 2018, as outlined in the table below.

Month	HAP/VOC Emissions (tons
July 2018	8.08
August 2018	12.16
September 2018	8.67
October 2018	13.15
November 2018	13.02
December 2018	12.95

7. 40 CFR PART 63, SUBPART MMMM - NATIONAL EMISSION STANDARDS FOR HAZARDOUS AIR POLLUTANTS FOR SURFACE COATING OF MISCELLANEOUS METAL PARTS AND PRODUCTS

   § 63.3881 Am I subject to this subpart?

   (b) You are subject to this subpart if you own or operate a new, reconstructed, or existing affected source, as defined in § 63.3882, that uses 946 liters (250 gallons (gal)) per year, or more, of coatings that contain hazardous air pollutants (HAP) in the surface coating of miscellaneous metal parts and products defined in paragraph (a) of this section; and that is a major source, is located at a major source, or is part of a major source of emissions of HAP. A major source of HAP emissions is any stationary source or group of stationary sources located within a contiguous area and under common control that emits or has the potential to emit any single HAP at a rate of 9.07 megagrams (Mg) (10 tons) or more per year or any combination of HAP at a rate of 22.68 Mg (25 tons) or more per year. You do not need to include coatings that meet the definition of non-HAP coating contained in § 63.3981 in determining whether you use 946 liters (250 gal) per year, or more, of coatings in the surface coating of miscellaneous metal parts and products.

§ 63.3883 When do I have to comply with this subpart?

The date by which you must comply with this subpart is called the compliance date. The compliance date for each type of affected source is specified in paragraphs (a) through (c) of this section. The compliance date begins the initial compliance period during which you conduct the initial compliance demonstration described in §§ 63.3940, 63.3950, and 63.3960.

(c) For an area source that increases its emissions or its potential to emit such that it becomes a major source of HAP emissions, the compliance date is specified in paragraphs (c)(1) and (2) of this section.

(2) For any portion of the source that becomes an existing affected source subject to this subpart, the compliance date is the date 1 year after the area source becomes a major source or 3 years after January 2, 2004, whichever is later.

(d) You must meet the notification requirements in § 63.3910 according to the dates specified in that section and in subpart A of this part. Some of the notifications must be submitted before the compliance dates described in paragraphs (a) through (c) of this section.

§ 63.3890 What emission limits must I meet?

(b) For an existing affected source, you must limit organic HAP emissions to the atmosphere from the affected source to the applicable limit specified in paragraphs (b)(1) through (5) of this section, except as specified in paragraph (c) of this section, determined according to the requirements in § 63.3941, § 63.3951, or § 63.3961.

(1) For each existing general use coating affected source, limit organic HAP emissions to no more than 0.31 kg (2.6 lb) organic HAP per liter (gal) coating solids used during each 12-month compliance period.

§ 63.3891 What are my options for meeting the emission limits?

You must include all coatings (as defined in §63.3981), thinners and/or other additives, and cleaning materials used in the affected source when determining whether the organic HAP emission rate is equal to or less than the applicable emission limit in §63.3890. To make this determination, you must use at least one of the three compliance options listed in paragraphs (a) through (c) of this section. You may apply any of the compliance options to an individual coating operation, or to multiple coating operations as a group, or to the entire affected source. You may use different compliance options for different coating operations, or at different times on the same coating operation. You may employ different compliance options when different coatings are applied to the same part, or when the same coating is applied to different parts. However, you may not use different compliance options at the same time on the same coating operation. If you switch between compliance options for any coating operation or group of coating operations, you must document this switch as required by § 63.3930(c), and you must report it in the next semiannual compliance report required in §63.3920.

(a) Compliant material option. Demonstrate that the organic HAP content of each coating used in the coating operation(s) is less than or equal to the applicable emission limit in § 63.3890, and that each thinner and/or other additive, and cleaning material used contains no organic HAP. You must meet all the requirements of §§ 63.3940, 63.3941, and 63.3942 to demonstrate compliance with the applicable emission limit using this option.

(b) Emission rate without add-on controls option. Demonstrate that, based on the coatings, thinners and/or other additives, and cleaning materials used in the coating operation(s), the organic HAP emission rate for the coating operation(s) is less than or equal to the applicable

emission limit in § 63.3890, calculated as a rolling 12-month emission rate and determined on a monthly basis. You must meet all the requirements of §§ 63.3950, 63.3951, and 63.3952 to demonstrate compliance with the emission limit using this option.

(c) Emission rate with add-on controls option. Demonstrate that, based on the coatings, thinners and/or other additives, and cleaning materials used in the coating operation(s), and the emissions reductions achieved by emission capture systems and add-on controls, the organic HAP emission rate for the coating operation(s) is less than or equal to the applicable emission limit in § 63.3890, calculated as a rolling 12-month emission rate and determined on a monthly basis. If you use this compliance option, you must also demonstrate that all emission capture systems and add-on control devices for the coating operation(s) meet the operating limits required in § 63.3892, except for solvent recovery systems for which you conduct liquid-liquid material balances according to § 63.3961(j), and that you meet the work practice standards required in § 63.3893. You must meet all the requirements of §§ 63.3960 through 63.3968 to demonstrate compliance with the emission limits, operating limits, and work practice standards using this option.

§ 63.3910 What notifications must I submit?

(a) General. You must submit the notifications in §§ 63.7(b) and (c), 63.8(l)(4), and 63.9(b) through (e) and (h) that apply to you by the dates specified in those sections, except as provided in paragraphs (b) and (c) of this section.

(b) Initial Notification. You must submit the initial notification required by § 63.9(b) for a new or reconstructed affected source no later than 120 days after initial startup or 120 days after January 2, 2004, whichever is later. For an existing affected source, you must submit the initial notification no later than 1 year after January 2, 2004...

(c) Notification of compliance status. You must submit the notification of compliance status required by § 63.9(h) no later than 30 calendar days following the end of the initial compliance period described in § 63.3940, § 63.3950, or § 63.3960 that applies to your affected source....

§ 63.3920 What reports must I submit?

(a) Semiannual compliance reports. You must submit semiannual compliance reports for each affected source according to the requirements of paragraphs (a)(1) through (7) of this section. The semiannual compliance reporting requirements may be satisfied by reports required under other parts of the Clean Air Act (CAA), as specified in paragraph (a)(2) of this section.

(1) Dates. Unless the Administrator has approved or agreed to a different schedule for submission of reports under § 63.10(a), you must prepare and submit each semiannual compliance report according to the dates specified in paragraphs (a)(1)(i) through (iv) of this section. Note that the information reported for each of the months in the reporting period will be based on the last 12 months of data prior to the date of each monthly calculation.

(i) The first semiannual compliance report must cover the first semiannual reporting period which begins the day after the end of the initial compliance period described in § 63.3940, § 63.3950, or § 63.3960 that applies to your affected source and ends on June 30 or December 31, whichever date is the first date following the end of the initial compliance period.

(ii) Each subsequent semiannual compliance report must cover the subsequent semiannual reporting period from January 1 through June 30 or the semiannual reporting period from July 1 through December 31.

(iii) Each semiannual compliance report must be postmarked or delivered no later than July 31 or January 31, whichever date is the first date following the end of the semiannual reporting period.

§ 63.3930 What records must I keep?

You must collect and keep records of the data and information specified in this section. Failure to collect and keep these records is a deviation from the applicable standard.

(a) A copy of each notification and report that you submitted to comply with this subpart, and the documentation supporting each notification and report. If you are using the predominant activity alternative under § 63.3890(c), you must keep records of the data and calculations used to determine the predominant activity. If you are using the facility-specific emission limit alternative under § 63.3890(c), you must keep records of the data used to calculate the facility-specific emission limit for the initial compliance demonstration. You must also keep records of any data used in each annual predominant activity determination and in the calculation of the facility-specific emission limit for each 12-month compliance period included in the semi-annual compliance reports.

(b) A current copy of information provided by materials suppliers or manufacturers, such as manufacturer's formulation data, or test data used to determine the mass fraction of organic HAP and density for each coating, thinner and/or other additive, and cleaning material, and the volume fraction of coating solids for each coating. If you conducted testing to determine mass fraction of organic HAP, density, or volume fraction of coating solids, you must keep a copy of the complete test report. If you use information provided to you by the manufacturer or supplier of the material that was based on testing, you must keep the summary sheet of results provided to you by the manufacturer or supplier. You are not required to obtain the test report or other supporting documentation from the manufacturer or supplier.

(c) For each compliance period, the records specified in paragraphs (c)(1) through (4) of this section.

(1) A record of the coating operations on which you used each compliance option and the time periods (beginning and ending dates and times) for each option you used.

(2) For the compliant material option, a record of the calculation of the organic HAP content for each coating, using Equation 2 of § 63.3941.

(3) For the emission rate without add-on controls option, a record of the calculation of the total mass of organic HAP emissions for the coatings, thinners and/or other additives, and cleaning materials used each month using Equations 1, 1A through 1C, and 2 of § 63.3951; and, if applicable, the calculation used to determine mass of organic HAP in waste materials according to § 63.3951(e)(4); the calculation of the total volume of coating solids used each month using Equation 2 of § 63.3951; and the calculation of each 12-month organic HAP emission rate using Equation 3 of § 63.3951.

(4) For the emission rate with add-on controls option, records of the calculations specified in paragraphs (c)(4)(i) through (v) of this section.

(d) A record of the name and volume of each coating, thinner and/or other additive, and cleaning material used during each compliance period. If you are using the compliant material option for all coatings at the source, you may maintain purchase records for each material used rather than a record of the volume used.

(e) A record of the mass fraction of organic HAP for each coating, thinner and/or other additive, and cleaning material used during each compliance period unless the material is tracked by weight.

(f) A record of the volume fraction of coating solids for each coating used during each compliance period.

(g) If you use either the emission rate without add-on controls or the emission rate with add-on controls compliance option, the density for each coating, thinner and/or other additive, and cleaning material used during each compliance period.

(h) If you use an allowance in Equation 1 of § 63.3951 for organic HAP contained in waste materials sent to or designated for shipment to a treatment, storage, and disposal facility (TSDF) according to § 63.3951(e)(4), you must keep records of the information specified in paragraphs (h)(1) through (3) of this section.

(i) You must keep records of the date, time, and duration of each deviation.

(j) If you use the emission rate with add-on controls option, you must keep the records specified in paragraphs (k)(1) through (8) of this section.

The Regulated Party has been subject to NESHAP MMMM since January 2, 2007 when it became a major source of HAP emissions by emitting more than 10 tons per year of a single HAP. Therefore, the Regulated Party should have complied with NESHAP MMMM by the compliance date, which was January 2, 2007.

In order to comply with NESHAP MMMM, the Regulated Party should have limited its organic HAP emissions to less than 2.6 pounds organic HAP per gallon coating solids used during each 12-month compliance period. The Regulated Party has only calculated NESHAP MMMM organic HAP emission for 2018, demonstrating an organic HAP emission of 86.16 pounds organic HAP per gallon coating solids. This is an exceedance of NESHAP MMMM's HAP limit by approximately 3314%.

The Regulated Party has not submitted the Initial Notification, due by January 2, 2005; Notification of Compliance Status, due by July 31, 2007; and Semiannual Compliance Reports due every January 31 and July 31, since July 2007 through July 31, 2018.

The Regulated Party has not calculated the organic HAP limit for any other time periods, stating that the records to do so are not available, and has not submitted the Initial Notification, Notification of Compliance Status, or any Semiannual Compliance Reports, even though the Regulated Party knew by at least June 28, 2018, based on its investigation and audit, that it was subject to NESHAP MMMM.

Part 7. REGULATED PAR7Y' *STATEMENT*

The Regulated Party acknowledges that the violations in Part 6 of this Agreement are alleged and that it is executing this Agreement and committing to the actions described in this Agreement to amicably resolve those alleged violations and address the related concerns of our community.

Upon the Regulated Party's discovery of potential non-compliance regarding TCE emissions the Regulated party immediately initiated an environmental audit and promptly reported the results to the MPCA in order to inform the MPCA of the potential non-compliance and facilitate a return to compliance as quickly as possible in cooperation with the MPCA.

The Regulated Party's environmental audit report to the MPCA included a commitment to investigate the feasibility of the use of a non-HAP solvent to replace TCE in its production processes. Since that time the Regulated Party identified a feasible non-HAP solvent and has voluntarily committed to eliminating the use of TCE in its facility.

Rart 8. CIVIL PENALTY.

The Regulated Party agrees to pay $4,500,000.00 to the MPCA as a civil penalty for the violations alleged in Part 6 within 30 days of receipt of an invoice from the MPCA. An invoice for the civil penalty will be sent to the Regulated Party upon the Effective Date of the Agreement. Payment of the penalty amount of $4,500,000.00 is to be by check payable to the Minnesota Pollution Control Agency and should not be submitted until an invoice from the MPCA is received.

The check must be mailed to MPCA, P.O. Box 64893, St. Paul, Minnesota, 55164-0893; or to make an electronic payment, contact MPCA Fiscal Services at 651-757-2182.

If the Regulated Party fails to make the required payment within 30 days after receipt of the above-referenced invoice, the Regulated Party agrees to pay a late payment charge in an amount equal to 10% of the unpaid civil penalty. Sixty days after the Effective Date of this Agreement, the Regulated Party agrees to pay an additional late payment charge in an amount equal to 20% of the unpaid civil penalty. If the payment, including late charges, is not received by the MPCA within 60 days after the Effective Date of this Agreement, the MPCA may immediately exercise any and all administrative and judicial remedies available to it to collect the amount due. The Regulated Party agrees to pay and shall also be indebted to the MPCA for its attorneys' fees and cost incurred by the MPCA in connection with its collection of the amounts owed pursuant to this Agreement.

Part9. *SUPPLElvirar» suvinouivizazAL PROJECTS*

a. The Regulated Party has proposed and the MPCA accepts the proposal to perform Supplemental Environmental Projects (SEPs) at a cost to the Regulated Party of at least $1,500,000.00

b. SEP 1 shall include the following: The Regulated Party shall coordinate with Tree Trust http://treetrust.org/ to complete tree planting and maintenance projects over 3 years of growing cycles (2019, 2020 & 2021). The Regulated Party shall purchase 1,500 #10 nursery container, or caliper equivalent trees to be planted over the three growing cycles in public and community areas, such as parks and nature centers. Priority placement shall begin with facility property placement to provide residential screening, with the balance of trees being placed within the geographical bounds of the communities of White Bear Lake, Gem Lake and White Bear Township, and extend outward in a 20-mile radius as necessary to place the trees advantageously. The total value of this SEP will be $750,000.00 The Regulated Party will be responsible for the project costs. This project will begin on the date this Agreement is signed and will end upon

submission of the final report. The Regulated Party shall provide the following information to the MPCA to document progress and completion of the project:

(1) The Regulated Party shall provide siting plans to the MPCA for each year including number of trees and proposed locations for each year's growing cycle prior to undertaking planting activities. Siting plans shall be due for spring planting events no later than April 30, 2019, 2020 and 2021 respectively; and for fall events no later than July 31, 2019, 2020 and 2021 respectively;

(2) The Regulated Party shall provide invoices or other documents showing the number of trees purchased each growing cycle. Documentation of purchase records shall be due no later than January 15th, 2020, 2021 and 2022 respectively;

(3) The Regulated Party shall provide a final report for each year (2019, 2020 and 2021) showing the number of trees planted and locations the trees were planted and the total costs incurred by the Regulated Party. The report shall also include dates of each planting event. Final reports shall be due no later than December 15, 2019, 2020 and 2021 respectively;

(4) The Regulated Party shall provide a final report demonstrating project completion describing the final maintenance activities performed (watering completion), the costs incurred by the Regulated Party, and the survival rate of the trees planted in each planting location. The final project report is due no later than January 1, 2024.

c. SEP 2 shall include the following: The Regulated Party shall coordinate with the Minnesota Technical Assistance Program http://www.mntap.umn.edu/ (MnTap) to provide support to reduce and eliminate TCE emissions at facilities using TCE. The Regulated Party will accomplish this by conducting testing on alternative solvents, conducting research and development related to alternative solvents and providing outreach related to that research, including proposing alternatives, providing transitional support, and providing general P2 assistance to the target group. The Regulated Party will be responsible for the project costs. Priority outreach will begin with facilities most likely to yield the greatest amount of TCE reduction at those facilities located most closely to the communities of White Bear Lake, White Bear Lake Township and Gem Lake and within a 40-mile radius of those municipalities. Secondly, priority is to be placed on facilities most likely to yield the most TCE reduction located in Environmental Justice communities, and lastly facilities most likely to yield the most TCE reduction statewide. The total value of this SEP will be $750,000.00 This project will take place beginning on the date this Agreement is signed and will terminate upon the Regulated Party providing its final report, which is due no later thah January 30, 2023. The Regulated Party shall provide the following information to the MPCA to document progress and completion of the project:

(1) The Regulated Party shall provide, no later than 60 days after the execution date of this Agreement, a Project Strategy and Work Plan for MPCA review and approval, that identifies the target facilities, including location; along with the specific tasks that will be completed as part of the effort, and how those tasks will be completed to emphasize both reduction and elimination of TCE by introducing alternatives, providing transitional support, and providing general P2 assistance. The Work Plan shall also include proposed outcomes of the project.

(2) The Regulated Party shall provide, no later than 30 days after the end of each calendar

year, an annual report, which shall describe the costs incurred by the Regulated Party, the number of facilities the Regulated Party provided with technical support, their locations, and the outcomes of those interactions in terms of TCE usage reduced or eliminated, and other P2 activities undertaken, and identifying all quantifiable TCE reductions.

(3) The Regulated Party shall provide, no later than January 30, 2023, a final report for the project summarizing all elements in the previous annual reports as well the most recent year to date results, which shall demonstrate project completion.

d. The SEPs and schedules above become enforceable terms of this Agreement upon execution of this Agreement. The Regulated Party understands that the actual cost of completion of any SEP may exceed the values listed above. The Regulated Party agrees to expend the amount of money necessary to complete the SEPs as described, and agrees that the Regulated Party shall receive no payment or other compensation for the work performed in completion of the SEPs. Nothing in this Agreement shall prevent the Regulated Party from seeking third-party contribution for penalties paid or costs incurred in implementing the SEPs or any other part of this Agreement, from any person who is not a party to this Agreement whom the Regulated Party reasonably believes is or may be liable to the Regulated Party. The Regulated Party shall maintain copies of all invoices, contracts, manifests, receipts, and any and all other documentation of the actual costs the Regulated Party incurs in completing the SEPs and shall provide cost documentation to the MPCA within 30 days of completing each SEP.

e. If the Regulated Party abandons any SEP prior to completion, the Regulated Party shall pay to the MPCA a civil penalty that represents the difference between the SEP pledge listed above and the amount expended by the Regulated Party as of the date of abandonment within 30 days after notice by the MPCA that the additional civil penalty is due. Payment of the above penalty amount is to be by certified check payable to the Minnesota Pollution Control Agency. The check must be mailed to MPCA, P.O. Box 64893, St. Paul, Minnesota, 55164-0893; or to make an electronic payment, contact MPCA Fiscal Services at 651-757-2182.

f. If the Regulated Party fails to make the required payment within 45 days after receiving notice from the MPCA that the additional civil penalty is due, the Regulated Party agrees to pay a late payment charge in an amount equal to 10 percent of the unpaid civil penalty. Sixty days after receiving notice from the MPCA that the additional civil penalty is due, the Regulated Party agrees to pay an additional late charge in an amoont equal to 20 percent of the unpaid civil penalty. If the payment, including late charges, is not received by the MPCA within 60 days after receiving notice from the MPCA that the additional civil penalty is due, the MPCA may immediately exercise any and all administrative and judicial remedies available to it to collect the amount due. The Regulated Party agrees to pay and shall also be indebted to the MPCA for its attorneys' fees and cost incurred by the MPCA in connection with its collection of the amounts owed pursuant to this Agreement.

Rart 10. REGULATED PARTY ***REQUIREMENTS.***

The Regulated Party agrees to the following requirements:

Emissions Inventory Reports

g. Within 30 days of the Effective Date of this Agreement, the Regulated Party shall compete and submit revised Emission Inventory Reports for 2002 to 2017.

THIS REQUIREMENT HAS BEEN COMPLETED.

h. Within 30 days of the Effective Date of this Agreement, submit a plan detailing steps that will be taken to ensure that all future coaters will be reported in the Emissions Inventory Report.

i. Within 30 days of the Effective Date of this Agreement, submit a plan detailing steps that will be taken to ensure that all actual emissions are reported in the Emissions Inventory Report.

Emissions Control Equipment

j. Within 30 days of the Effective Date of this Agreement, submit a plan detailing a timeline for replacing CE003.

k. Within 10 days of beginning construction on the replacement control equipment for CE003, submit a notification to the MPCA.

l. Within 10 days of starting up the replacement control equipment for CE003, submit a notification to the MPCA.

m. Within 30 days of starting up the replacement control equipment for CE003, conduct a VOC performance test. Follow all applicable performance testing rules, including pre-test notification and approval.

n. Within 30 days of conducting a VOC performance test on the new control equipment, submit the VOC test report to the MPCA.

o. Within 45 days of conducting a VOC performance test on the new control equipment, submit a Testing Frequency Plan.

NESHAP MMMM

p. Within 30 days of the Effective Date of this Agreement, submit the Initial Notification, and Notification of Compliance Status, dating back to 2007, as required by NESHAP MMMM.

q. Within 30 days of the Effective Date of this Agreement, submit a plan detailing steps that will be taken to re-establish the Facility as a non-major source of HAP, so that NESHAP MMMM no longer applies.

THIS REQUIREMENT HAS BEEN COMPLETED

Emission Units Required to be Permitted

r. Within 30 days of the Effective Date of this Agreement, submit a plan detailing steps that will be taken to ensure that all future sources of emissions are adequately evaluated to determine if they are insignificant.

Deviation Reizorts And Calculations

s. Within 30 days of the Effective Date of this Agreement, submit updated Semiannual Deviation Reports and Compliance Certifications, reporting all deviations and excess emissions that have occurred since 2002.

t. Within 30 days of the Effective Date of this Agreement, submit HAP and VOC calculations from 2002 to 2009.

THIS REQUIREMENT HAS BEEN COMPLETED

u. Within 30 days of the Effective Date of this Agreement, submit emissions calculations regarding the plastic manufacturing at the southern campus.

THIS REQUIREMENT HAS BEEN COMPLETED

Preservation of Documents

v. The Regulated Party shall preserve all documents, including emails and electronic correspondence, in its possession, custody, or control that relate to this Agreement, any alleged violation in Part 6, and the following:

(4) TCE purchases, waste, usage, reports, and any concerns, including but not limited to, concerns regarding TCE's effects on health and human safety or the environment, since 2000;

(5) (2) TCE recovery, including but not limited to, when the amount recovered and length of time TCE was being recovered, at the Facility since 2000;

(6) CE003's operation, including but not limited to, records related to what days CE003 was operating, since its installation;

(7) CE003's control efficiency, including but not limited to, CE003's failure to maintain 95% efficiency, since its installation;

(8) CE003's maintenance, including but not limited to, any regularly scheduled maintenance, breakdown reports, and correspondence with the manufacturer or third parties about CE003 since its installation;

(9) Documents related to or that could be used to estimate HAP calculations since 2002.

w. The Regulated Party shall not destroy any documents in its possession, custody, or control related to this Agreement, the alleged violations in Part 6, and the above listed categories p (1)-(6) until three years following the termination of this Agreement pursuant to Part 24.

Investigation, Monitoring, or Remediation

x. If the MPCA reasonably determines, after reviewing the reports identified above in Part 10, including to any investigation and remediation work plans, that additional investigation or monitoring is required, or that additional response actions are reasonable and necessary to protect public health, welfare or the environment, the MPCA shall notify the Regulated Party.

y. Within 30 days after receipt of the notification from the MPCA, which shall include a complete description of the basis for the determination, the Regulated Party shall submit information to the MPCA for review and approval.

z. The Regulated Party's failure to provide information or to provide deficient information will be considered a violation of this Agreement. Upon approval from the MPCA to conduct investigation, work plans, or a response action, the Regulated Party shall implement any approved plan in accordance with the time schedules in the plan.

aa. Within 30 calendar days of the Effective Date of this Agreement, the Regulated Party shall hire a qualified environmental consultant to develop an investigation work plan (Work Plan), following the Risk Based Site Characterization and Sampling Guidance Document on the MPCA Web site at https://www.pca.state.mn.us/waste/risk-based-site-evaluation-guidance. Prior to submittal of the Work Plan, the consultant may contact staff Hydrogeologist, Michael Ginsbach at 651-757-2329 or michael.ginsbach@state.mn.us with questions regarding Work Plan content. The Work Plan shall

contain a time schedule for implementation. The Work Plan shall describe in detail the steps that will be taken to accomplish the following:

(1) Conduct a survey of the Facility, including processing, storage, and loading and unloading areas, to determine and define any areas or processes that may be a source of contamination. The survey shall include an assessment of the flooring surfaces within the buildings to identify any cracks, cold joints or other potential pathways where contaminants may have been able to be released into the environment.

(2) Collect samples from soil, groundwater, surface water, sediment, soil vapor, and private drinking water wells as necessary to define the extent and magnitude of contamination that may have been caused by the Regulated Parties activities at its Facility, including the production and storage of battery terminals and fishing sinkers and any other activities that have occurred on the property over the past 70 years; and analyze the samples for volatile organic carbons and lead using approved methods under U.S. Environmental Protection Agency SW-846 or equivalent methods.

bb. Within 60 calendar days of the Effective Date of this Agreement, the Regulated Party shall file an application with the MPCA to enter the remediation program as a Voluntary Responsible Party. The online application can be found here https://www.pca.state.mn.us/data/e-services.

cc. Within 75 calendar of the Effective Date of this Agreement, the Regulated Party shall submit the Work Plan created as described in Paragraph a. above, to the MPCA for review and approval. The Work Plan shall be designed to define the magnitude and extent of releases to soil, groundwater, surface water, sediment, and soil vapor. The Work Plan shall be submitted along with the application to the remediation program described in Paragraph b. above. If the Work Plan is found to be deficient or inadequate, the MPCA will require re-submittal of the Work Plan until it is approvable. After MPCA approval of the Work Plan, the Regulated Party shall implement the Work Plan in accordance with the approved time schedule in the Work Plan. Completion of the approved Work Plan according to its terms and the approved time schedule shall be enforceable requirements of this Agreement.

dd. Within 75 calendar days of after completion of the Work Plan under the approved time schedule, the Regulated Party shall submit a Remedial Investigation Report (Remedial Report) to the MPCA for review and approval. The Remedial Report shall describe the nature and extent of contamination, field sampling, and analytical procedures used, and shall make recommendations for future site investigation or remediation.

ee. After review of the results and findings of the Work Plan and the recommendations in the Remedial Report, MPCA staff will determine if further investigation or remedial actions are necessary. The investigation shall continue until the extent and magnitude of contaminant releases that occurred on site are fully defined, both on and off site, to the satisfaction of the MPCA. If further investigation or remedial action is required, the MPCA will require the Regulated Party to submit to the MPCA for approval a Supplemental Investigation Work Plan (Supplemental Work Plan) or Remedial Action Plan (RAP) and a schedule which addresses the outstanding requirements detailed in the MPCA request.

If. The Regulated Party agrees to continue to work cooperatively with the MPCA Remediation Program until they receive a No Further Action Letter. Failure to complete investigation and remediation required by the MPCA may subject the Regulated Party to additional enforcement actions under other authorities, including but not limited to the Minnesota Environmental Response and Liability Act (MERLA) or the Resource Conservation and Recovery Act (RCRA) and nothing in this

Agreement shall be construed as limiting MPCA's authority to require the Regulated Party to complete the investigation and remediation.

Alternative Operating Scenario

gg. The MPCA will allow the Regulated Party to resume coating operations under an approved Alternative Operating Scenario, as outlined below, until the Regulated Party's new air emissions permit is issued. If the Regulated Party fails to complete any of the requirements listed below or the MPCA determines any information provided is deficient, the Regulated Party is prohibited from continuing its coating operations. The MPCA also reserves the right to terminate the Alternative Operating Scenario and prohibit the Regulated Party from continuing to resume coating operations allowed under this Alternative Operating Scenario at any time if the MPCA Commissioner determines that is necessary to protect human health, safety or the environment. The parties agree that the MPCA Commissioner's decision to terminate the Alternative Operating Scenario shall be final and not subject to the Resolution of Disputes in Part 14. The parties further agree that the MPCA's allowing the Regulated Party to resume coating operations under this Alternative Operating Scenario does not vest the Regulated Party with any protectable interest and that should the MPCA Commissioner terminate the Alternative Operating Scenario, the Regulated Party will not suffer any irreparable harm. Before the Regulated Party may begin to operate under the Alternative Operating Scenario and resume coating operations, the Regulated Party shall complete the following requirements:

hh. Remove all TCE containing material from the facility and provide information to the MPCA confirming this.

THIS REQUIREMENT HAS BEEN COMPLETED.

ii. Submit a new air permit application that includes limits the coating operations solvent to HAP free-solvents.

THIS REQUIREMENT HAS BEEN COMPLETED.

jj. Submit an air monitoring plan, subject to MPCA approval, including proposed siting of VOC ambient monitors, proposed monitoring frequencies for VOC ambient monitors, proposed specific monitors, proposed contractor to gather the samples, proposed lab that will analyze the samples, and proposed lab turnaround time for sample results.

1. The proposed siting for the ambient monitors shall follow EPA siting guidance as much as possible, however the MPCA understands that due to property details the Regulated Party will not be able to completely adhere to the guidance.
2. The lab shall provide results within 48 hours until six consecutive, valid sampling events have occurred.
3. After six consecutive, valid sampling events, then the lab shall provide results within 14 calendar days.

THIS REQUIREMENT HAS BEEN COMPLETED.

kk. Submit a Quality Assurance Project Plan (QAPP), subject to approval, according to the requirements of Appendix M. The requirements for a QAPP are available in EPA Requirements for Quality Assurance Project Plans: EPA QA/R-5.

THIS REQUIREMENT HAS BEEN COMPLETED.

ll. Upon approval of the air monitoring plan and the QAPP by the MPCA, install the ambient monitors in the approved location.

THIS REQUIREMENT HAS BEEN COMPLETED.

mm. Upon completion of the above requirements, the Regulated Party may resume coating operations subject to the limitations and requirements in this Alternative Operating Scenario.

Upon resuming coating operation and as a requirement to continue this Alternative Operating Scenario, the Regulated Party shall

nn. Notify the MPCA within 24 hours of resuming coating operations.

oo. Limit FluoSolv usage to less than or equal to 0.90 tons per calendar day, calculated as a 24 hour sum. This limit applies to all FluoSolv used in all coaters at the Facility.

pp. On each day of operation calculate, record, and maintain a record of the total tons of FluoSolv used at the Facility by 10:00 am the following calendar day for the previous 24-hour period. This shall be based on daily weight scale readings of containers of FluoSolv used at the Facility and the density of FluoSolv taken from the most recent SDS or Certificate of Analysis. This record must be maintained as an unlocked editable excel spreadsheet.

qq. By 12:00 pm every calendar day submit the unlocked editable excel spreadsheet daily FluoSolv use record to the MPCA detailing the total tons of FluoSolv used for the previous 24-hours.

rr. Utilize the approved contractor to conduct ambient air monitoring for VOC emissions as outlined in the approved monitoring plan. Monitoring must begin the first day coating operations resume and will not conclude until termination of the Agreement.

ss. VOC, and trans-1,2-dichloroethylene (trans-1,2-DCE), monitor results shall be submitted to the MPCA directly from the approved lab within 48 hours until six consecutive, valid sampling events have occurred. After six consecutive, valid sampling events the time for the lab to provide results to the MPCA shall be no greater than 14 calendar days per sampling event. The monitoring results must report the VOC and trans-a,2-DCE concentrations in micrograms per cubic meter. The MPCA reserves the right to request a EPA Air Method Toxic Organics-15 (TO-15), or the top five tentatively identified compounds (TICs) identified in the monitoring results.

tt. If the laboratory results demonstrate an exceedance of the trans-1,2-DCE 70 micrograms per cubic meter limit in a 24 hours sample, the Regulated Party shall, on the same day that the laboratory results are received, decrease the daily FluoSolv limit by 0.10 tons per calendar day for each trans-1,2-DCE monitor concentration exceedance. This reduced amount will become the new daily limit. The Regulated Party shall reduce by this method until the laboratory results no longer demonstrate an exceedance of the trans-1,2-DCE 70 micrograms per cubic meter limit in a 24 hour sample. For example:

1. After receiving the first exceedance, the new daily limit will be 0.80 tons per calendar day.
2. After receiving the second exceedance, the new daily limit will be 0.70 tons per calendar day.

3. After receiving the third exceedance, the new daily limit will be 0.60 tons per calendar day.

uu. Limit VOC emissions to 90 tons per year, calculated by the 15th day of each month, as a 12 month rolling sum, using a mass balance calculation. Submit this record by the 15th day of each month to the MPCA. The new air emissions permit will incorporate this record and the 12 month rolling sum will continue after the new air permit is issued.

vv. Notify the MPCA within 1 calendar day after any change to FluoSolv's formulation, as it is described in the Safety Data Sheet (SDS) submitted to the MPCA on January 25, 2019.

Part 11. ***RENALTIES FOR VIOLATIONS OF THIS AGREEMENT.***

a. If the Regulated Party fails to comply with requirements of Part 10 of this Agreement, the Regulated Party shall pay to the MPCA a penalty in the amount of $500.00 per requirement for each day of failure.

b. Penalties for failure to comply with requirements of Part 10 of this Agreement shall accrue from the date the Regulated Party was to have fulfilled the requirement until the Regulated Party fulfills the requirement. Penalties shall not accrue while the MPCA considers a timely extension request under Part 16 or during dispute resolution under Part 14, unless the MPCA determines that the Regulated Party filed the request or initiated dispute resolution solely for purposes of delay. If the Regulated Party does not pursue dispute resolution under Part 14 for denial of a timely extension request, penalties shall accrue from the date the extension request is denied by the MPCA Case Contact. If the Regulated Party pursues dispute resolution for denial of an extension request and does not file a timely challenge in a court of competent jurisdiction as provided by Part 14, penalties shall accrue from the date of a Commissioner's dispute resolution decision against the Regulated Party until the Regulated Party fulfills the requirement that is the subject of the extension request.

c. The Regulated Party shall pay a penalty under this Part within 30 days after receiving written notice from the MPCA that the penalty is due, unless the Regulated Party has challenged the factual basis of a penalty asserted under this Part under the dispute resolution provision of Part 14, in which case the penalty, if still applicable, shall be due within 30 days of final resolution of the dispute under Part 14. The written notice shall specify the provision of the Agreement that the Regulated Party has not fulfilled and indicate the date penalties began to accrue. If the Regulated Party fails to make timely payment, the Regulated Party agrees to pay a late payment charge, in addition to the stipulated penalty, to be assessed as follows. Forty-five days after receipt of written notice, the Regulated Party shall be obligated to pay a late charge in an amount equal to 10% of the unpaid stipulated penalty. Sixty days after receipt of written notice, the Regulated Party shall be obligated to pay an additional late charge in an amount equal to 20% of the unpaid stipulated penalty.

d. In dispute resolution before the Commissioner under Part 14, the Regulated Party can contest the factual basis for the MPCA's determination that the Regulated Party has not fulfilled a requirement of this Agreement covered by this Part. However, the Regulated Party waives its right to challenge, on legal grounds, the requirement that it pay penalties under this Part.

e. The Regulated Party shall not be liable for payment of penalties for failure to comply with requirements of Part 10 of this Agreement covered by this Part if it has submitted to the MPCA a timely request for an extension of schedule under Part 16 and the MPCA has granted the request. The MPCA's grant of an extension of schedule waives the payment of penalties covered by this Part only on the requirements for which the MPCA granted an extension of schedule and only for the time period

specified by the MPCA in the grant of an extension. An extension of schedule for one requirement of Part 10 does not extend the schedule for any other requirement of Part 10.

f. Any requirement of this Agreement may be enforced as provided in Minn. Stat. 9115.071. Payment of a stipulated penalty does not relieve the Regulated Party of its obligation to fulfill and complete requirements under the Agreement and to otherwise comply with the terms and conditions of the Agreement.

Part 12. ***COVENANT NOT TO SUE*** VIVO ***RESERVATION OF*** REMEOf£S.

With respect to the Regulated Party, the MPCA agrees not to exercise any administrative, legal or equitable remedies available to the MPCA to address the violations alleged and described in Part 6 as long as the Regulated Party performs according to and has complied with the terms and conditions contained in this Agreement.

The MPCA reserves the right to enforce this Agreement or take any action authorized by law, if the Regulated Party fails to comply with the terms and conditions of this Agreement.

Further, the MPCA reserves the right to seek to enjoin violations of this Agreement and to exercise its emergency powers pursuant to Minn. Stat. §§ 116.11 and Minn. Stat. 115.071 in the event conditions or the Regulated Party's conduct warrant such action. Nothing in this Agreement shall prevent the MPCA from exercising these rights and nothing in this Agreement constitutes a waiver of these rights.

The MPCA reserves the right to pursue recovery for Natural Resource Damages pursuant to Minn. Stat. § 115.071, Minn. Stat. ch. 115B4 or other laws. Nothing in this Agreement shall prevent the MPCA from exercising these rights and nothing in this Agreement constitutes a waiver of these rights.

The Regulated Party agrees to waive all claims it may now have, as of the effective date of this Agreement, under Minn. Stat. § 15.472 for fees and expenses arising out of matters leading up to and addressed in this Agreement.

Part *t3. REPEAT VIOLATIONS.*

Federal and state environmental programs establish harsher penalties for violations of environmental laws or rules that constitute repeat violations. In a proceeding to resolve alleged violations by the Regulated Party, if any, occurring after the date of the alleged violations set out in Part 6 of this Agreement, the Regulated Party may argue about the extent to which the violations alleged in Part 6 of this Agreement should affect the penalty amount for the later violations, but waives the right: (1) to contend that the violations alleged in Part 6 of this Agreement did not occur as alleged and (2) to require the MPCA to prove the violations alleged in Part 6 of this Agreement.

Part *t4. RESOLUTION OF DISRUTES.*

The parties to this Agreement shall resolve disputes that arise as to any part of the Agreement as follows:

a. Either party, acting through its Case Contact (as named in Part 17 below), may initiate dispute resolution by providing to the Case Contact of the other party an initial written statement setting forth the matter in dispute, the position of the party, and the information the party is relying upon to support its position.

The other party, acting through its Case Contact, shall provide a written statement of its position and supporting information to the Case Contact of the initiating party within 14 calendar days after receipt of the initial written statement.

b. If the parties, acting through their Case Contacts, do not reach a resolution of the dispute and reduce such resolution to writing in a form agreed upon by the parties within 21 calendar days after the initiating party receives the statement of position from the responding party, the Commissioner shall issue a written decision resolving the dispute. The written decision may address stipulated penalties assessed pursuant to Part 8. The Commissioner's decision shall be considered a final decision of the MPCA for purposes of judicial review.

c. The Commissioner's decision shall become an integral and enforceable part of this Agreement unless the Regulated Party timely challenges the decision in a court of competent jurisdiction. Failure to timely challenge means the Regulated Party agrees to comply with the MPCA Commissioner's decision on the matter in dispute and to pay any penalties that accrue pursuant to Part 8 for failure to fulfill requirements of this Agreement that are the subject of the dispute resolution. Further, if the Commissioner's decision assesses penalties pursuant to Part 8 of this Agreement, the Regulated Party agrees to and shall pay the amount of penalty determined by the Commissioner within 60 days after receiving the Commissioner's decision.

d. Throughout any dispute resolution, the Regulated Party shall comply with all portions of the Agreement that the MPCA determines are not in dispute.

Part 15. VENUE.

Actions brought by the MPCA to enforce requirements and terms of this Agreement shall be venued in Ramsey County District Court.

Rart 16. EXTENSION OF SCHEDULES.

If the Regulated Party wants an extension of a deadline included in any schedule under this Agreement, including schedules established by approved submittals, the Regulated Party must request the extension in writing at least ten days before the scheduled deadline, or as soon as possible before that date if the reason for the extension request arises less than ten days before the deadline.

Each deadline extension request shall separately specify the reason why the extension is needed. No requested extension shall be effective until approved in writing by the MPCA, acting through the MPCA Case Contact or the Commissioner.

The MPCA shall grant an extension only for the period of time the MPCA determines is reasonable under the circumstances. The written approval or grant of an extension request shall be considered an enforceable part of the Agreement.

The Regulated Party has the burden of demonstrating to the satisfaction of the MPCA that the request for the extension is timely, and that good cause exists for granting the extension. Good cause can include, but is not limited to, delays caused by the MPCA in reviewing timely submittals required by this Agreement, submitted by the Regulated Party in complete and approvable form, which make it not feasible for the Regulated Party to meet the required schedules.

Good cause does not include unanticipated costs, increases in the cost of control equipment, or delays in MPCA review of submittals when the submittals are not in complete and approvable form. The Regulated Party may challenge a decision by the MPCA to deny a request for an extension under this Part.

Part *&7. CASE courAcr.*

The MPCA and the Regulated Party shall each designate a Case Contact for the purpose of overseeing the implementation of this Agreement. The MPCA Case Contact is Jennifer Carlson. The

address, telephone number, and email address of the MPCA's Case Contact is: 520 Lafayette Road North, St. Paul, MN 55155, 651-757-2538, and jennifer.m.carlson@state.mn.us. The MPCA Supplemental Environmental Project (SEP) Contact is Sarah Kilgriff. The address, telephone number, and email address of the MPCA's SEP Contact is: 520 Lafayette Road North, St. Paul, MN 55155, 651-757-2492, sarah.kilgriff@state.mn.us. The Regulated Party's Case Contact is Denise L'Allier-Pray. The address, telephone number, and email address of the Regulated Party's Case Contact is: 4400 Otter Lake Road, White Bear Township, MN 55110, 651-209-9441, denise.l'allier-pray@watergrem.com. Either party may change its designated Case Contact by notifying the other party in writing, within five days of the change. To the extent possible, communications between the Regulated Party and the MPCA concerning the terms and conditions of this Agreement shall be directed through the Case Contacts.

Part 18. *APPLICABLE LAWS AND PERMITS.*

This Agreement does not relieve the Regulated Party of the duty to comply with the requirements of all applicable federal, state and local laws and regulations, including without limitation in the Regulated Party's undertaking actions to comply with this Agreement. Except when the MPCA has specifically authorized a different compliance method in Part 10, the Regulated Party must also comply with all applicable permits, orders, stipulation agreements and schedules of compliance. Nothing in this Agreement exempts or relieves the Regulated Party of its obligation to comply with local governmental requirements.

Part 19. *OTHER CLAIMS.*

Nothing herein shall release the Regulated Party from any claims, causes of action or demands in law or equity by any person, firm, partnership, corporation or state entity not a signatory to this Agreement for any liability it may have arising out of or relating to the release of any pollutant or contaminant from its operations or from its Facility. Nor shall anything herein release the Regulated Party from any claims, causes of action or demands in law or equity by the MPCA reserved above in Part 12. Neither the Regulated Party nor the MPCA shall be held as a party to any contract entered into by the other party to implement the requirements of this Agreement.

Part 20. *HOLD HARMLESS AGREEMENT.*

The Regulated Party agrees to indemnify, save and hold the MPCA, its agents and employees harmless from any and all claims or causes of action arising from or on account of acts or omissions of the Regulated Party, its officers, employees, agents, or contractors in implementing the activities conducted pursuant to this Agreement; provided, however, that the Regulated Party shall not indemnify the MPCA or save or hold its employees and agents harmless from any claims or causes of action arising out of the acts or omissions of the MPCA, or its employees and agents.

When the Regulated Party is required to hold the MPCA harmless, the MPCA shall give the Regulated Party notice of any claim or cause of action subject to this Part and the Regulated Party has the right to participate in the defense against any claim or cause of action. No settlement shall be effective against the Regulated Party unless the Regulated Party agrees to the settlement. Nothing herein waives or modifies the provisions of the Minnesota Tort Claims Act, Minn. Stat. §§ 3.732, et seq., and other applicable law.

Part 21. *SUCCESSORS, AGENTS AND CONTRACTORS*

This Agreement shall be binding upon the Regulated Party and its successors and assigns and upon the MPCA, its successors and assigns. If the Regulated Party sells or otherwise conveys or assigns any of its right, title or interest in the Facility, the conveyance shall not release the Regulated Party from any

obligation imposed by this Agreement, unless the party to whom the right, title or interest has been transferred or assigned agrees in writing to fulfill the obligations of this Agreement and the MPCA approves the transfer or assignment. The Regulated Party shall ensure that the Regulated Party's agents, contractors and subsidiaries comply with the terms and conditions of this Agreement.

Part 22. *AMENDMENTS.*

Except with respect to extensions of schedules granted under Part 16 and approved submittals under Part 10, this Agreement may be amended only by written agreement between the parties.

Part 23. *EffE€TIVE DATE.*

This Agreement shall be effective on the date it is signed by the MPCA.

Part 24. *TERMiu» now.*

The provisions of this Agreement shall be deemed satisfied and terminated when the Regulated Party receives written notice from the MPCA that the Regulated Party has demonstrated, to the satisfaction of the MPCA, that all terms of the Agreement have been completed. Termination of this Agreement does not release the Regulated Party from any duty to comply with any statutes, rules or permit conditions, whether or not they are cited in this Agreement. The Regulated Party agrees that it shall retain all records related to this Agreement for three years following its termination. Termination of this Agreement does not release the Parties from Parts 12 (Covenant Not To Sue And Reservation Of Remedies), 13 (Repeat Violations) and 20 (Hold Harmless Schedule), which terms shall survive the termination of this Agreement.

BY THEIR SIGNATURES BELOW, THE UNDERSIGNED REPRESENT THAT THEY HAVE AUTHORITY TO BIND THE PARTIES THEY REPRESENT

SUMMARY OUTPUT for Subset: Stack VOC concentration (ppmvw) on VOC usage (lb/day)

Regression Statistics	
Multiple R	0.7563
R Square	0.5720
Adj. R^2	0.5679
Std Error	11
N	107

ANOVA

Matirx X'X

107	21187
21187.2	5157625

Matrix $(X'X)^{-1}$

0.05009	-2.06E-04
-2.06E-04	1.04E-06

At α = 0.05, 2-tail t is: 1.983

Two equations are shown in this scatter plot. At the lower-left corner is one for the mean prediction. The other one, at the upper-right corner, is for the upper bound, which is very close to the upper end of the 95% confidence interval of a new VOC concentration value (ppmvw) in response to a new value of VOC usage. The upper bound equation is convenient to use in supporting the air permit action.

Note that the data analyzed here were from 1/30/2020 through 6/3/2020 (the printout of this worksheet lists only a portion of the data).

$X_h'(X'X)^{-1}$		$X_h'(X'X)^{-1}X_h$	Constant	New Usage	Ypred

Size of matrix X (cells B3:C109): 107 x 2. → Sum = 2

Another way to do is, avg = 2 / 107 → Avg = 0.0187 Values in column W are referred to as "leverage."

"Rule of thumb" is: 2 x avg leverage → 0.0374

Minitab: min{0.99; 3 x avg leverage} → 0.0561 which happens to be > any value in cells W3:W109.

Attachment 8. MDH Risk Assessment Advice for trans-1, 2-Dichloroethylene

DEPARTMENT OF HEALTH

Water Gremlin

HEALTH ASSESSMENT SERIES I TRANS-1,2-DICHLOROETHYLENE IN AIR AND HEALTH

At a Glance

- A general overview of the published toxicity studies indicates that t-DCE displays relatively low toxicity. However, information regarding possible health effects from breathing t-DCE over long periods is lacking and no studies have been conducted to assess possible cancer risk.
- In January 2019, MDH developed chronic Risk Assessment Advice (RAA) specifically for t-DCE air permitting applications at the Water Gremlin facility. The RAA, which is defined as an amount that is safe to breathe daily for a lifetime, was 70 µg/m3 (micrograms per cubic meter).
- The Minnesota Pollution Control Agency (MPCA) used air modeling to determine that Water Gremlin could emit 92 tons of t-DCE per year without exceeding an annual average concentration of 70 µg/m3 in air outside of the Water Gremlin property boundary.
- Water Gremlin used t-DCE during March 2019-August 2019, then again from January 2020 to the present. Sixty tons of t-DCE was used from March 2019 to March 2020.
- Air monitoring around the Water Gremlin facility began on March 1, 2019, and is on-going. Monitoring results are highly variable, reflecting variations in weather (mainly wind speed and direction) and the rate of t-DCE use at the facility.
- In April 2020, MDH revised the t-DCE chronic RAA to 20 µg/m3, and developed a subchronic RAA value of 200 µg/m3 for exposures greater than 30 days up to 8 years.
- MDH does not expect health effects to occur in the community from Water Gremlin's past or current emissions of t-DCE.

Purpose

This document describes

- how MDH uses t-DCE toxicology studies and risk assessment to develop air guidance values,
- how MDH Risk Assessment Advice developed in January 2019 was used to set limits for Water Gremlin t-DCE emissions,
- the results of the t-DCE air monitoring data from monitors on Water Gremlin's property,
- the new MDH Risk Assessment Advice for t-DCE developed in April 2020, and
- Water Gremlin's t-DCE emissions and MDH conclusions about health risk.

What is *trans*-1,2-Dichloroethylene (t-DCE)?

t-DCE is a clear liquid that is highly flammable and evaporates easily (part of a chemical class called volatile organic compounds or VOCs). It is used as a solvent for cleaning and degreasing, as well as a propellant and blowing agent (U.S. EPA, 2019). It has recently been used as an alternative to trichloroethylene (TCE). Exposure occurs mainly by breathing it in at workplaces where t-DCE is made or used.

After Water Gremlin was forced to stop TCE use in January 2019, they expressed interest in resuming coating operations with a product called FluoSolv WS (NuGenTec, 2019). FluoSolv is composed primarily of t-DCE, and its use in coating would result in air emissions of t-DCE.

What Happens to t-DCE in the Air?

When t-DCE gas is continuously released into the air there can be localized elevated air concentrations. Farther away from the source t-DCE mixes into the atmosphere by spreading out in all directions and becomes increasingly diluted. t-DCE is also broken down in the atmosphere. It takes about five days for an amount of t-DCE in air to reduce by half by breaking down (U.S. EPA, 2010). t-DCE is not expected to settle on soil or surface water, and any that does would evaporate back into the air quickly.

What Happens to t-DCE in the Body?

t-DCE is a volatile, fat-soluble compound that is quickly taken up through the lungs and gastrointestinal tract (ATSDR 1996). While t-DCE is fat-soluble, there is no solid data indicating accumulation in the liver, brain, kidney, or other fat tissue following exposure. t-DCE can be metabolized in the liver, as shown by rodent studies. It is likely broken down into more water-soluble metabolites which are quickly removed by the kidneys (ATSDR 1996; U.S. EPA 2010). Some studies show the body can eliminate t-DCE by exhaling it (U.S. EPA 2010).

MDH Risk Assessment Advice – January 2019

In January 2019, MPCA requested that MDH develop a site-specific air guidance value that could be used to determine a safe amount of t-DCE that Water Gremlin could release into the air.

MDH derived a *chronic* inhalation value of 70 µg/m^3 (micrograms per cubic meter) as Risk Assessment Advice (RAA), or an amount that is safe to breathe daily for a lifetime. The RAA was developed to be protective against immune system effects that were shown in a study of mice exposed to t-DCE in drinking water. Exposures to t-DCE in amounts greater than 70 µg/m^3 does not mean health effects are likely, especially if they only occur episodically and for less-than-lifetime durations. However, the risk of health effects generally increases as the amount and duration of chemical exposures increase.

MDH's RAA was unable to take into account the minor constituents of FluoSolv WS, hydrofluoroethers, because toxicological data are unavailable. Hydrofluoroethers are very persistent chemicals that are added to make the FluoSolv mixture non-flammable.

A description of how air guidance values are developed using toxicology studies and risk assessment is below.

Toxicology Studies and Risk Assessment

Risk assessment is a science-based tool used to evaluate the potential effects of a chemical on human health. Risk assessment uses the best available scientific information, as well as professional judgment and policy, to estimate risks in a standardized way to help make informed decisions about managing or reducing risks.

To determine a safe level of exposure to contaminants, scientists frequently rely on animal studies. In these studies, animals in a laboratory (often rodents) are exposed to large amounts of a chemical of

interest at different doses and durations; acute (hours), subchronic (often 90 days), and chronic (often 1-2 years). Because it is unclear how well short-term, high exposure tests on animals predict how people may respond to low level exposures over a longer period of time, scientists err on the side of caution when determining safe exposure amounts for people. This is generally done by dividing the amounts shown to cause an effect in study animals by uncertainty factors of 10 to 3,000 to arrive at an amount expected to be safe for all members of the population. Greater reductions are used when there is less certainty in the scientific data available. Using such margins of safety increases confidence that health effects would be extremely unlikely at the calculated safe amount, even among sensitive individuals such as children and pregnant women.

The U.S. Environmental Protection Agency (EPA) completed a review of t-DCE in 2010 (U.S. EPA, 2010). EPA states that a general overview of the toxicity studies conducted indicates t-DCE displays low toxicity. However, there is a lack of information regarding the possible health effects from breathing t-DCE over long periods. EPA concluded that there was insufficient inhalation data to support deriving a safe air value for long-term (chronic) exposures. EPA also states that there is "inadequate information to assess the carcinogenic potential" of t-DCE based on the absence of human or animal cancer studies.

Although there are no chronic studies of t-DCE, there are several subchronic animal studies (U.S. EPA, 2010). Five studies exposed rodents to t-DCE by drinking water or food, and two studies exposed rodents by inhalation (one unpublished). Changes in liver and kidney weight were the main effects observed (EPA, 2010).

The results of the two inhalation studies were inconsistent. A limitation to both was that exposures occurred intermittently (six and eight hours/day) rather than continuously. With intermittent dosing, exposure concentrations should be adjusted to reflect a continuous exposure to use for calculating health risk values. The earliest study (Fruendt et al., 1977) showed an effect of fat accumulation in the liver and liver cells in rodents exposed to t-DCE at 794,000 µg/m^3 [equivalent to 200 parts per million (ppm)]. The Agency for Toxic Substances and Disease Registry (ATSDR) used this study's results to develop *acute* and *subchronic* air values of 790 µg/m^3 (dividing the effect level by an uncertainty factor of 1,000) based on fat accumulation in liver cells (ATSDR, 1996).

In 2006, EPA used the same study results to derive a "provisional" *chronic* air value of 60 µg/m^{3}by adjusting the 794,000 µg/m^{3}dose to a continuous exposure and dividing by an uncertainty factor of 3,000 (U.S. EPA, 2014). EPA did not derive a *subchronic* value at that time. However, when EPA did a more thorough toxicological review of t-DCE in 2010, they declined to calculate an air value based on this study's data because of its limitations and a lack of corroboration with other studies (U.S. EPA, 2014). A later unpublished subchronic rodent inhalation study (DuPont, 1998) did not show any effects even at doses of 15,800,000 µg/m^3.

In their 2010 toxicological review, EPA determined there was enough information to derive a safe amount for oral exposure to t-DCE. A subchronic drinking water study showing rodent immune suppression (Shopp et al., 1985) was used to derive a safe amount of t-DCE that could be consumed by people over a lifetime (0.02 milligram/kilogram-day). EPA applied an uncertainty factor of 3,000 to account for differences between animals and humans, variability among humans, use of a subchronic study, and a lack of additional studies. In January, 2019, MDH used this oral dose to derive a *chronic* air guidance value, by converting the oral exposure to an air exposure to arrive at the 70 µg/m^3 site-specific RAA for t-DCE use at Water Gremlin.

MPCA Air Modeling

Air quality dispersion modeling uses computer simulation to predict pollutant concentrations at different locations and distances from a source. MPCA uses the AERMOD dispersion model, developed and recommended by the U.S. EPA, to estimate the levels of air pollutants emitted from sources. MPCA conducted air modeling of proposed Water Gremlin t-DCE emissions to back-calculate an annual emission rate that would not result in long-term exceedances of the t-DCE inhalation RAA that MDH developed in January 2019. According to the MPCA's modeling, 92 tons of t-DCE could be emitted in a year without exceeding an annual average concentration of 70 µg/m^3 in air outside of the property.

Restart of Coating Operations – March 2019

Water Gremlin resumed coating operations using t-DCE in place of TCE, on March 1, 2019, after MPCA and Water Gremlin signed a settlement agreement to resolve the company's air quality violations. The agreement limited Water Gremlin's total VOC emissions to 90 tons per year, as a 12 month rolling sum, using a mass balance calculation that assumes all of the t-DCE used in operations is emitted to air, except any that is accounted for as leaving the facility as liquid waste. Based on the air modeling described above, this 90-ton-per-year limit prevents the annual average t-DCE levels from exceeding the RAA of 70 µg/m^3 in locations where people live.

On August 22, 2019, MPCA ordered Water Gremlin to suspend the operation of the coating lines because t-DCE was found in the soil vapor beneath the building. See Water Gremlin Health Assessment Series: Soil Vapor and Health (https://www.health.state.mn.us/communities/environment/hazardous/docs/sites/ramsey/wgsoilvapor.pdf) for more information. Because of this suspension, t-DCE use lasted for slightly under six months in 2019. The coating lines remained shut down until January 21, 2020. Use of the coating lines was phased in slowly, and some lines transitioned to a water-based coating. As a result, less t-DCE was used in 2020 each month (through March) compared to monthly active coating operations in 2019. The one year period of t-DCE use (from March 2019- March 2020) totaled 60 tons. The 12 month rolling sum is currently decreasing due to the reduced use of t-DCE. For additional information and a chart of the t-DCE emissions as a rolling sum, see the MPCA Water Gremlin air monitoring webpage (https://www.pca.state.mn.us/air/water-gremlin-air-monitoring).

Air Monitoring for t-DCE – Data from March 2019 to March 2020

The 2019 settlement agreement required Water Gremlin to conduct ambient air monitoring. Five air monitors were placed on the Water Gremlin property near the property boundaries. Beginning on March 1, 2019, 24-hour samples were collected every three days, and analyzed for a standard list of VOCs. Monitoring results are highly variable; reflecting variation in weather (mainly wind speed and direction) and the rate of t-DCE use at the facility.

During the period from March 1 to August 22, 2019 when FluoSolv was used, t-DCE results ranged from not detected (shown by a < symbol and a number which is the lowest level detectable) to 648 µg/m^3 as summarized in the table below.

t-DCE Air Monitoring Results on Water Gremlin Property from 3/1/19 to 8/22/19 (µg/m^3)

Monitor location	Minimum	Maximum	Median*	Average
East	<1.1	205	11	29
North	<1	208	5	33
Northwest	<1.1	149	5	21
South	<1.1	104	4	15
West	<1.1	648	21	86

* A median is the middle value of the results (approximately half the results are less than and half the results are greater than the median). When the monitors did not detect any t-DCE, MDH used the detection limit (rather than zero) when calculating the median and average results.

Air monitoring at the five monitors on the Water Gremlin property continued during the time the coating lines were shut down. Out of a total of 237 individual samples analyzed from 48 sampling days during the shutdown period, low levels of t-DCE were detected in only 16 samples, ranging from 1.2 to 5.6 µg/m^3.

Use of t-DCE resumed on January 21, 2020, at lower quantities than in 2019. At the end of April 2020, monitoring results reflected this decline in use of t-DCE in 2020 for coating (see below; ranging from not detected to 97 µg/m^3).

t-DCE Air Monitoring Results on the Water Gremlin Property from 1/21/20 to 4/30/20 (µg/m^3)

Monitor location	Minimum	Maximum	Median	Average
East	<1	52	1.7	7.1
North	<1	60	1.2	6.6
Northwest	<1	47	1.2	4.6
South	<1.1	51	3.3	8.3
West	<1	97	1.2	10

MPCA installed additional VOC monitors at Birch Lake Elementary School (north of Water Gremlin) and Columbia Park (northwest of Water Gremlin) to provide air monitoring results in the community. Only two 24-hour samples (see below) were collected at these monitors before the t-DCE coating shut down on August 22, 2019. MPCA reported that a majority of the subsequent sampling results at these locations have not detected t-DCE. This additional data will be provided on the MPCA website this summer.

5

t-DCE Air Monitoring Results at Birch Lake Elementary and Columbia Park (µg/m^3)

Monitor location	8/13/19	8/19/19
Birch Lake Elementary	0.79	16 (estimated)
Columbia Park	1.3	3.9

More information about air monitoring at and near the Water Gremlin facility and all of the results can be found on the MPCA Water Gremlin air monitoring webpage (https://www.pca.state.mn.us/air/water-gremlin-air-monitoring)

MDH Risk Assessment Advice – April 2020

In 2020, MDH conducted a re-evaluation of t-DCE toxicity studies that could be used to develop an air guidance value. No new studies were identified. However, an improvement in the modeling of the data in the study used to derive the 2019 RAA was discovered (California EPA, 2018). MDH, in consultation with the U.S. EPA, decided to use the improved study model data. Using these data, MDH updated its *chronic* inhalation RAA for t-DCE to 20 µg/m^3. MDH also developed a *subchronic* inhalation value for t-DCE of 200 µg/m^3. A *subchronic* duration is defined as a repeated exposure for greater than 30 days and up to 10% of an average human lifespan (eight years).

MDH Risk Assessment Advice (RAA) for *trans*-1,2-Dichloroethylene

Duration	2019 RAA (µg/m^3)	2020 RAA (µg/m^3)	Health Endpoint
Acute (up to 24 hours)	ND	ND	
Short-term (> 24 hours to 30 days)	ND	ND	
Subchronic (> 30 days to 10% of a lifetime)	ND	**200**	Immune System
Chronic (> 10% of a lifetime to a lifetime)	70	**20**	Immune System
Cancer (lifetime)	ND	ND	

ND = Not derived

The 2020 RAA values are based on the amount of t-DCE (approximately 50,000 µg/m^3) where an immune system effect was observed in a subchronic animal study. Therefore, it is expected that a small risk of immune system effects may exist for people exposed to t-DCE repeatedly at 50,000 µg/m^3. The RAA is much lower than this to reflect uncertainties in the data and the desire to develop a safe exposure level for the population, including vulnerable subgroups.

Other t-DCE Air Values

Occupational Values

While occupational limits can provide context for ambient air concentrations, MDH believes that these values are sometimes not protective of worker health over the long-term, and certainly are not adequate to protect the general population. The Occupational Safety and Health Administration (OSHA), the National Institute for Occupational Safety and Health (NIOSH), and the American Conference of Governmental Industrial Hygienists all have adopted occupational criteria for 1,2-DCE (note this is a mixture of t-DCE and *cis*-1,2-DCE) over a work day of 200 parts per million in air-- equivalent to 790,000 µg/m^3. NIOSH lists symptoms of occupational exposure as irritation of the eyes and respiratory system, as well as a central nervous system depression. These values are intended to allow workers to be able to do their work safely and may not be protective for long-term exposure.

Other State Values

While there is wide agreement that toxicity data needed to derive a chronic air value for t-DCE is lacking, it is arguably helpful to have some value that limits air emissions, or provides some assessment of health risk, rather than no value at all. Some states use or have developed chronic t-DCE air values (ranging from 60–80 µg/m^3) based on the ATSDR and EPA values discussed above for use in soil and groundwater cleanup programs. The Michigan Department of Environmental Quality's Air Quality Division took a slightly different approach and developed a chronic t-DCE air value of 200 µg/m^3 (MDEQ, 2016) for air quality permitting purposes based on the same study MDH used for the RAA. States often use different uncertainty factors or other parameters in their risk assessment calculations resulting in a range of values that reflect differences in policies, changes in application over time, and even varying scientific opinions. MDH's professional judgment about developing an inhalation values for t-DCE appears to generally be in line with decisions other states have made to address this chemical, although the 2020 chronic RAA may now be the most protective value in the country.

Water Gremlin t-DCE Emissions in Air and Health

The outdoor air surrounding Water Gremlin is affected by use of t-DCE at the facility. Air concentrations from the five monitors on the Water Gremlin property are highly variable, based largely on weather and facility use. The t-DCE from Water Gremlin is expected to spread out in air surrounding the facility similar to past TCE emissions, although current use of t-DCE is significantly lower than past use of TCE.

In 2020, MDH developed safe inhalation values for t-DCE for two different exposure durations – *chronic*, for up to a lifetime of exposure, and *subchronic*, defined as repeated exposure for greater than 30 days, up to 10% of an average lifetime (8 years). The subchronic value was developed in response to community member's requests to help understand shorter duration health risks.

While recent exposure to t-DCE from Water Gremlin is a subchronic duration, the more appropriate objective of controlling ongoing facility emissions is to remain at or below the chronic air guidance of 20 µg/m^3. This is particularly true in a community where past emissions of TCE were excessive.

MDH does not expect health effects in the community from Water Gremlin's past or current emissions of t-DCE. Given the available air monitoring data on the Water Gremlin property, and what can be estimated from modeling, there were times when air concentrations were over the current chronic RAA value (20 µg/m^3) beyond Water Gremlin's property boundary, and very limited times when air

7

concentrations were over the subchronic RAA value (200 µg/m^3) for a short duration. However, neither the chronic nor subchronic RAA were exceeded for a length of time that poses a health concern. The air monitoring results on the Water Gremlin property are also higher than actual exposures to t-DCE (how much t-DCE enters the body through breathing) experienced by people in the community.

Are Some People at Greater Risk?

As a general rule, MDH considers women who are pregnant or may become pregnant, infants and children, the elderly, and people living with chronic disease or a compromised immune system to be more sensitive to exposure to chemicals. MDH's air guidance values are developed to be protective of people who may be more susceptible.

There is no information available regarding t-DCE exposure and effects to a developing human fetus or small children. Based on the results of only one animal study, t-DCE is not currently expected to cause developmental effects in people, but the information is too limited to draw this conclusion (U.S. EPA, 2010).

Attachment 9. MDH trans-1,2-dichloroethylene 2020 Risk Assessment Advice Follow-up

DEPARTMENT OF HEALTH

memo

DATE: July 13, 2022

TO: Kari Palmer, Manager, Air Assessment Section, Minnesota Pollution Control Agency

FROM: James Kelly, Manager, Environmental Assessment and Surveillance Section

SUBJECT: trans-1,2-dichloroethylene (CAS No. 156-60-5) 2020 Risk Assessment Advice Follow-up

Commented [A77]: See petition for contested case hearing and comment letter on MDH risk assessment.

This memorandum is in response to your email of April 26, 2022 regarding the Minnesota Department of Health (MDH) risk assessment advice (RAA) for trans-1,2-dicholoroethylene (tDCE). In January 2019, at the request of the Minnesota Pollution Control Agency (MPCA), MDH developed risk assessment advice (RAA) for trans-1,2-dicholoroethylene (tDCE). This request was made after the Water Gremlin facility switched from trichloroethylene (TCE) to tDCE following many years of emitting significantly more TCE than allowed by their air permit, at times over 100 tons per year. Some nearby residents of White Bear Township were exposed to airborne concentrations of TCE above the MDH health-based value (HBV) of 2 ug/m^3 possibly as early as 1992.

The mission of MDH is to protect, maintain, and improve the health of all Minnesotans. With this mission in mind, MDH initially derived RAA for air using route-to-route (RTR) extrapolation from the 2010 U.S. Environmental Protection Agency's Integrated Risk Information System's (EPA IRIS) reference dose (RfD). The EPA IRIS RfD was developed from the subchronic oral (drinking water) mouse study by Shopp et al. 1985. In Shopp et al. 1985, tDCE exposed mice were evaluated for humoral immune status as measured by the ability of spleen cells from these mice to produce splenic immunoglobulin M (IgM) antibody forming cells (AFCs) against sheep red blood cells (sRBC), hemagglutination titers to sRBC, and by spleen cell response to spleen lymphocyte responsiveness (LPS). Decreased number of AFCs against sRBCs in male mice was selected as the critical health effect.

In 2020, MDH's Health Risk Assessment (HRA) Unit reevaluated the tDCE RfD (based on Shopp et al. 1985) because of improvements to Benchmark Dose Software (BMDS) modeling (as described in MDH 2020a, 2020b). This updated MDH RfD was then used to update the air RAA for tDCE (MDH 2020a). If MDH had not developed tDCE RAA, Water Gremlin's emissions would have been released into the surrounding community without a tDCE-protective ambient air limit. This does not align with MDH's mission to protect the health of all Minnesotans, particularly the White Bear Township residents who have already been exposed to prolonged, elevated concentrations of TCE above the MDH air HBV.

Currently, inhalation toxicity information for tDCE is limited. The EPA IRIS 2010 Toxicological Review of cis- and trans-1,2-dichloroethylene concluded there was insufficient inhalation data to support deriving a safe air value for tDCE exposure (EPA IRIS 2010). The EPA IRIS 2010 toxicological review of tDCE

describes two inhalation studies that were evaluated for a potential reference concentration (RfC) by EPA IRIS and MDH, Freundt et al. 1977 and DuPont 1998 (abstract published by Kelly). The Freundt study was the principal study for the 2006 Provisional Peer-Reviewed Toxicity Value (PPRTV) tDCE chronic p-RfC assessment by the EPA. Per a June 17, 2014, EPA memorandum "Removal of the trans-1,2-Dichloroethylene (CASRN 156-60-5) PPRTV assessment from the Electronic Library" (attachment 1), the 2006 PPRTV p-RfC was removed from the PPRTV database based on the conclusions of EPA IRIS 2010 that the study was insufficient for deriving an RfC. EPA IRIS 2010 (reiterated in EPA's 2014 memo) also found DuPont 1998 to be insufficient for deriving an RfC.

EPA IRIS 2010 summary regarding DuPont 1998:

> *The RfC for trans-1,2-DCE was reevaluated in light of the submission of an unpublished report by DuPont (1998) (previously described in the Kelly (1999) abstract) during the public comment period. The DuPont (1998) study was reviewed and considered as a potential principal study for RfC derivation. A summary and evaluation of the study findings were added to Sections 4.2.2.2, 4.6.2.2, and 5.2.2. Relative liver and kidney weight changes in the DuPont (1998) study, while likely treatment related, were relatively small, not generally statistically significant and, therefore, were not considered to be an appropriate basis for the derivation of an RfC. Some statistically significant hematology findings were reported in the DuPont (1998) study (see a summary and discussion of these findings in Sections 4.6.2.2 and 5.2.2). The toxicological significance of these effects is not clear. No effects on spleen or thymus weight were found at 90 days, and no histopathological changes in these organs were reported. DuPont suggested that decreases in WBC count and lymphocytes were secondary to "stress" and elevated endogenous glucocorticoids. While the study authors did not provide support for this hypothesis, the phenomenon of irritation/stress leading to decreased WBC or lymphocyte counts has been observed following other chemical exposures (see discussion in Section 5.2.2). Further, a similar reduction in WBC and lymphocyte counts was not observed in the 90-day NTP (2002a) dietary study of trans-1,2-DCE. For these reasons, identification of hematological changes as a potential critical effect was not considered scientifically supported. Therefore, while changes in some endpoints in the DuPont (1998) study were attributed to trans-1,2-DCE exposure, none of the effects were identified as potential critical effects because of the magnitude of the effect or questions about the biological significance of the effect.*

The DuPont 1998 study finding are summarized by EPA IRIS 2010 as:

> *Clinical chemistry changes observed in the DuPont (1998) study were generally not dose dependent, were transient (i.e., observed at 45 but not 90 days) or of small magnitude, and were not considered by the investigators to be toxicologically important. No statistically significant or toxicologically important analytical urine changes occurred during this study. Hematological analysis of blood samples collected on days 45 and 90 revealed a few statistically significant hematological findings in male and female rats. Mean hemoglobin concentration and hematocrit were statistically significantly decreased in the 1,000- and 4,000-ppm males at the 45-day sampling time and mean monocyte*

count was statistically significantly decreased in the 4,000-ppm females at the 45-day sampling time; these changes were not considered to be toxicologically important because the changes were small in the context of historical controls and a similar change did not occur at the 90-day sampling time. Generally, dose-related decreases in white blood cell (WBC) and lymphocyte counts were observed at both 45 and 90 days in male and female rats.

At the high dose, WBC count decreased about 20% in male rats and 18% in female rats compared to the control; lymphocyte levels decreased about 25% in males and about 22% in females.

In general, organ weights in exposed rats showed no statistically or biologically significant changes (<10%) relative to the control (DuPont, 1998). Relative adrenal weight (as percent of body weight) was statistically significantly reduced in male rats at 1 month recovery at the mid concentration (1,000 ppm or 3,960 mg/m3) but not at the high concentration (4,000 ppm or 15,800 mg/m3) of trans-1,2-DCE. In male rats at zero day recovery, increases in relative liver weight (as percent of body weight) ranged from 4 to 8% and were not dose related. Similarly, increases in relative liver weight (as organ to brain weight ratio) in male rats were 4, 4, and 6% at concentrations of 200, 1,000, and 4,000 ppm (or 792, 3,960, and 15,800 mg/m3), respectively. In female rats at zero day recovery, increases in relative liver weight (as percent of body weight) were 1, 5, and 6% at concentrations of 200, 1,000, and 4,000 ppm (or 792, 3,960, and 15,800 mg/m3), respectively. Increases in relative liver weight (as organ to brain weight ratio) in female rats at zero day recovery were 2, 8, and 8% at concentrations of 200, 1,000, and 4,000 ppm (or 792, 3,960, and 15,800 mg/m3), respectively. Increases in relative kidney weight for male and female rats (both as percent of body weight and as organ to brain ratio) were <10% and were not generally dose-related. For male rats, relative kidney weights ranged from 0 to 6% and from 3 to 5% as percent of body weight and as organ to brain weight ratio, respectively. Relative kidney weight for female rats ranged from 2 to 5% as percent of body weight and from 5 to 8% as organ to brain weight ratio. No histopathological changes were related to exposure to trans-1,2-DCE.

The DuPont 1998 authors themselves did not consider the decreased white blood cell (WBC) and lymphocyte levels in male rats at only the highest exposure dose (15,800 mg/m^3) to be toxicologically relevant as the decrease was small in the context of historical controls and may be the result of endogenous glucocorticoid (a class of steroid hormones released in response to stress in vertebrates; important for immune system functioning) release. Glucocorticoid release in stressed rodents from other chemical and nonchemical stressors and subsequent decreases in leucocytes and lymphocytes or redistribution have been reported in other studies (Shimizu et al. 2000, Dhabhar et al. 1995, Brondeau et al. 1990; Jensen 1969). However, DuPont 1998 did not report any data to attest to this plausible yet potential stress effect.

While EPA IRIS 2010 found the DuPont study insufficient for an RfC, it did acknowledge their findings may provide some support for the published, peer-reviewed critical oral study by Shopp et al. 1985 immune system endpoints:

> *The possibility exists that the decreased WBC and lymphocyte counts in rats in the DuPont (1998) inhalation study represent an effect on the immune system. Oral toxicity findings for the trans-isomer provide limited support for this possibility. Shopp et al. (1985) reported suppression in humoral immune status (i.e., decrease in AFC in response to sRBC challenge) in male mice exposed to trans-1,2-DCE by ingestion, but cell-mediated immune status in these mice was unaffected. Statistically significant changes in WBC and lymphocyte counts were not identified by NTP (2002a) in their 90-day oral (feed) study. It is noteworthy that no histopathological changes of the spleen and thymus were seen in rats at any exposure concentration in the DuPont (1998) study—findings that would be consistent with a direct effect of trans-1,2-DCE on the immune system. The considerable variability in WBC and lymphocyte counts across studies and with the age of the rat within a study was also taken into consideration in evaluating the toxicological significance of these hematologic endpoints. For example, mean lymphocyte counts in control male and female rats ranged from 4,250-6,160/µL (males) and 3,390-7,400/µL (females) in seven recent NTP 90-day inhalation toxicity studies in rats.[1] Lymphocyte counts in controls in the DuPont (1998) study similarly showed considerable variability; control lymphocyte counts (mean ± SD) (in /µL) were 12,901 ± 1,961 (male rat) and 10,239 ± 4,147 (female rat).*

As already noted, PPRTV chose to remove a 2006 p-RfC citing EPA IRIS's 2010 outline of deficiencies for the Freundt 1977 as stated in the EPA 2014 memo. Then in 2020, EPA's Office of Research and Development Center for Public Health and Environmental Assessment opted in its PPRTV assessment to resurrect DuPont's designated 'insufficient and not scientifically supported critical effects' study by EPA IRIS 2010 to derive a screening level p-RfC for use at Superfund sites. The 2014 EPA memo states:

> *In summary, the available inhalation data from DuPont (1998) and Freundt et al. (1977) were considered insufficient to support reference value derivation and, therefore, an RfC for trans-1,2-DCE was not derived. Current practice by the PPRTV Program states that once an IRIS assessment becomes available for any given chemical, the PPRTV assessment for that chemical is removed from the PPRTV electronic library. Thus, based on this practice and the rationale outlined above, it is recommended that the conclusions presented in the IRIS assessment for trans-1,2-DCE be presently adhered to, and the trans- 1,2-DCE PPRTV assessment has been removed from the electronic library.*

It is unclear if PPRTV will retain this screening level p-RfC for an extended period or will again remove it as it does not align with the conclusions of the EPA IRIS 2010 review regarding use of the DuPont 1998 study or Freundt et al. 1977.

Per standard MDH practice, when new chemical information or studies are released, they are reviewed for critical or new key information. This type of documentation allows MDH to decide if this new information is compelling enough to warrant an update to an existing health protective air (or water) guidance value.

[1]Control lymphocyte data at 13- or 14-weeks on study were taken from NTP 90-day inhalation toxicity studies in the rat for vanadium pentoxide (NTP, 2002b), propylene glycol mono-t-butyl ether (NTP, 2004a), stoddard solvent IIC (NTP, 2004b), decalin (NTP, 2005), divinylbenzene-HP (NTP, 2006), α-methylstyrene (NTP, 2007), and cumene (NTP, 2009).

In fall of 2020, PPRTV provided a screening level p-RfC for screening Superfund sites. A PPRTV screening level value is derived when it is inappropriate to derive a provisional RfC. Available data do not meet all requirements for deriving a provisional toxicity value and are associated with more uncertainty than a provisional RfC.

MDH reviewed the 2020 PPRTV tDCE report when it was publicly released. The PPRTV report did not present new studies, did not provide improvements to reported data, and relied on an unpublished study (no peer-review process) deemed insufficient because of toxicologically questionable endpoints by EPA IRIS 2010. MDH considered the Shopp et al. 1985 drinking water study to be superior for tDCE as it reports on a specific challenge and response to the rodent immune system and not just a standard blood count panel as in Dupont 1998. Also, the drinking water pathway represents a more continuous internal exposure to the rodent rather than a six-hour episodic exposure occurring five days per week where recovery over 18-hour periods and weekends is likely. MDH was not compelled by the PPRTV report to change the current health protective 2020 RAA (which is two-fold lower than the PPRTV for the chronic value, 20 ug/m^3 versus 40 ug/m^3). As already outlined above, the hematological endpoints reported by DuPont 1998 were not scientifically supported and was designated as insufficient to derive an RfC by EPA IRIS in 2010 and again by EPA in the 2014 memo specifically regarding PPRTV's development of a tDCE provisional RfC. DuPont 1998 has reported immune system endpoints (questionable and small decreases to WBC and lymphocyte) which does somewhat support the established immune-related endpoints (decreased humoral immune response) from the EPA IRIS 2010 RfD critical study, Shopp et al. 1985.

MDH acknowledges the limitations associated with RTR extrapolation. In the absence of sufficient/acceptable inhalation data and with the utmost priority being the protection of public health (particularly considering the White Bear community had already experienced prolonged, elevated exposures to TCE from Water Gremlin) the decision was made to utilize RTR extrapolation from the published, peer-reviewed EPA IRIS 2010 and MDH critical study, Shopp et al. 1985 – immune system endpoints.

Relevant studies investigating liver and pulmonary endpoints did not indicate obvious portal of entry or hepatic first-pass effect concerns. Four subchronic oral rodent studies (NTP 2002, Barnes et al. 1985, Hayes et al. 1987 and key study Shopp et al. 1995) were evaluated and described in EPA IRIS 2010 to determine the IRIS RfD (see Table 1). Among NTP 2002, Barnes et al. 1985, and Hayes et al. 1987 key effects associated with oral (drinking water or dietary) tDCE exposure that were identified include decreased body weight gain, effects on organ weights (liver, kidney, thymus, and lung), minimal changes in liver function enzymes, decreased mean body weight, and minimal decreases in hematological parameters. While liver weight was increased in some oral studies it was not found to be hepatotoxic.

Freundt et al. (1977) observed increased incidences of lung and liver lesions (pulmonary capillary hyperemia and distension of the alveolar septum and fatty accumulation in liver lobules and Kupffer cells) at 793 mg/m^3 in rats exposed for up to 16 weeks. The lung lesions were similarly observed after intraperitoneal injection and oral exposures, suggesting that the effects may be systemic. However, the Freundt et al. study has limitations. No evidence of liver or respiratory toxicity was observed in rats from the 90-day subchronic DuPont 1998 study despite it being an inhalation exposure scenario and tDCE is well absorbed in the lung (PPRTV 2020). No lung pathology was observed in the 90-day study by DuPont

(1998) at a concentration approximately 20-fold higher than that used by Freundt et al. (1977) (EPA IRIS 2010).

From PPRTV 2020 on DuPont 1998:

> *Gross examinations were done at necropsy; liver, kidneys, lungs, testes, ovaries, adrenal glands, and brain were weighed, and samples from >45 tissues from 10 males and 10 females from the control and high-exposure groups were fixed in formalin or Bouin's solution, embedded in paraffin, stained with H & E, and examined microscopically. For low- and mid-exposure groups, the nose, pharynx/larynx, lungs, liver, kidneys, heart, and reproductive organs were microscopically examined. No histopathology was done on recovery animals owing to the lack of treatment-related lesions in the nonrecovery, high-exposure group.*

Histological changes from immune system organs that would include bone marrow, spleen, and thymus gland are not corroborated by DuPont 1998. Again, changes to WBC counts to the DuPont study rats could be attributed to stressed animals and may only serve to support the findings of Shopp et al, 1985.

Table 1. Summary of Relevant tDCE Oral and Inhalation Study Endpoints (as described in EPA IRIS 2010 table 4-13).

Reference	Dose Pathway	Exposure Duration	Species, n	Dose Range	Observed Effects
NTP, 2002	Diet	14 wk	Rat, 9-10/sex/dose	0 – 3245 mg/kg-d	M: Decreased BW gain (6%) at the high dose was not considered a LOAEL. F: ↑ Rel liver wt (10%). The biological significance of ↓ RBC count in M (≥380 mg/kg-d) and F (≥1,580 mg/kg-d) was unclear and not used to identify the LOAEL.
NTP, 2002	Diet	14 wk	Mouse, 10/sex/dose	0 – 8065 mg/kg-d	M: ↑ Rel liver wt (9%). At 8,065 mg/kg-d, ↓ BW gain (~7%). F: ↑ Rel liver wt (11%). Decreased body weight gain (6%) at 1,830 mg/kg-d was not considered a LOAEL.
Hayes et al. 1987	Drinking water	90 d	Rat, 20/sex/dose	0 – 3114 mg/kg-d	F: ↑ Abs kidney wt (8%).
Barnes et al. 1985	Drinking water	90 d	Mouse, 15-23/sex/dose	0 – 452 mg/kg-d	M: ↑ Rel liver wt (8%). F: ↓ Rel thymus wt (18%). Changes in clinical chemistry parameters were sporadic and not used to identify a LOAEL.
Shopp et al. 1985	Drinking water	90 d	Mouse, 8-12/sex/dose	0 – 452 mg/kg-d	M: ↓ sRBC-responsive cells (26%).
Freundt et al. 1977	Inhalation	8 hr/d, 5 d/wk for 1, 2, 8, and 16 wks	Rat, female 6/conc	0 or 792 mg/m^3 (single exposure dose)	F: Fat accumulation in the liver and Kupffer cells.
DuPont 1998	Inhalation	6 hr/d, 5 d/wk for 90 d	Rat, 15/sex/conc	0, 792, 3,960, or 15,800 mg/m^3	M and F: Decreased lymphocyte count reported (statistically significant in high-concentration M only); biologicalsignificance unclear and not used to identify the LOAEL.

↓ = decrease; ↑ = increase; abs = absolute; BW = body weight; dw = drinking water; F = females; M = males; ND = not determined; NOAEL = no-observed-adverse-effect level; rel = relative; wt = weight

Overall, MDH was not compelled by PPRTV's 2020 *screening level* p-RfC to change the established MDH 2020 RAA. The screening level PPRTV was developed as it was inappropriate to derive a provisional RfC. The screening level p-RfC was simply developed as a value to assist with initial risk assessments at Superfund sites. The original 2006 p-RfC PPRTV was removed as the Freundt et al. 1977 and DuPont 1998 studies were both deemed insufficient for RfC development. The unpublished DuPont 1998 study results are also not scientifically supported by EPA IRIS 2010. MDH chose to proceed with the

established Shopp et al. 1985 study as it reported endpoints from an actual challenge to immune system functions and developed RAA for tDCE in the interest of public health protection. It is worth noting again, White Bear residents had already been exposed to TCE over an extended period at concentrations well over MDH's TCE HBV (2 ug/m^3). TCE also has immune system endpoints (decreased thymus weight and cancer), for chronic air exposure durations (MDH 2018). The health effects of a chronic TCE exposure followed by tDCE exposure are unknown at this time. MDH determined that using an unpublished, insufficient study, reporting scientifically unsupported critical health endpoints (that would effectively double the current chronic MDH RAA) was not in the best interest of public health.

Lastly, health begins where we live, learn, work, and play. We all live in conditions that we cannot individually control but that can affect our health, and multiple environmental exposures can further stress our health. The 2020 MDH RAA and PPRTV screening level p-RfC were released during a time when Minnesota, and the rest of the world, was besieged by COVID-19. The immune system effects (immunotoxic effects) reported as the critical health endpoint established by Shopp et al. 1985, and albeit marginally, supported by DuPont 1998, added to the decision by MDH not to change its 2020 RAA to a less protective value. Scientific peer-reviewed studies regarding immunotoxic chemicals are concluding that industrial chemicals and air pollutants can contribute to an association with COVID-19 disease severity (Bashir et al., 2020; reviewed by Quinete and Hauser-Davis, 2021). Several other studies (as reviewed by Selgrade 2007) have shown that suppression of immune responses in rodents is predictive of suppression of immune responses in humans for various environmental contaminants in air, water, and diet. Recently, certain chemicals that are known to be immunotoxic, for example some endocrine disruptors, plasticizers, metals, perfluorinated alkylate substances (PFAS), and nitrogen dioxide, are linked to increased COVID-19 severity (Ogen 2020; Bornstein et al. 2020; Quinete and Hauser-Davis, 2021). These chemicals and chlorinated volatile organic compounds, like TCE and tDCE, may not have the same mechanisms of action or the same properties of absorption, metabolism, distribution, and excretion in the body, but they are all immunotoxicants, which may deleteriously affect Minnesotans' already stressed immune systems. No studies were found linking COVID-19 severity and TCE or tDCE as yet, but both chemicals have been shown to affect the immune system in animal models.

MEMORANDUM

DATE: June 17, 2014

SUBJECT: Removal of the *trans*-1,2-Dichloroethylene (CASRN 156-60-5) Provisional Peer-Reviewed Toxicity Value (PPRTV) assessment from the Electronic Library

FROM: Scott Wesselkamper
Director, Superfund Health Risk Technical Support Center (STSC)
EPA/ORD/NCEA

TO: Michele Burgess (OSWER/OSRTI)
Lynn Flowers (NCEA)
Teresa Shannon (NCEA)
The File

It was brought to the attention of the STSC that there is an inconsistency in the conclusions regarding the derivation of a reference concentration (RfC) for *trans*-1,2-Dichloroethylene (DCE) between the 2006 PPRTV assessment and the 2010 IRIS assessment (http://www.epa.gov/iris/toxreviews/0418tr.pdf) for this chemical. The 2006 PPRTV assessment derived a chronic p-RfC of 0.06 mg/m^3 based on pulmonary and liver effects observed in the principal study by Freundt et al. (1977). No subchronic p-RfC was derived. The 2010 IRIS assessment found Freundt et al. (1977), a study by the National Toxicology Program (NTP, 2002), and an unpublished study by DuPont (1998) to be insufficient to support derivation of an RfC value for *trans*-1,2-DCE. Thus, there appears to be a fundamental difference in how the principal study and critical effect(s) used to derive the chronic p-RfC in the 2006 PPRTV assessment were evaluated compared to what was more recently done by IRIS. It is important to note that there are some differences in the respective decision-making processes for developing PPRTV and IRIS assessments, specifically with the IRIS Program having a more extensive review process (e.g., agency and interagency review steps, a public comment period, etc.) than that utilized for developing PPRTV assessments.

Pertinent information from the 2010 IRIS Toxicological Review on *trans*-1,2-DCE that outlines why the Freundt et al. (1977) study was discounted and no RfC value was derived is excerpted and italicized below:

"The finding of lung effects in the Freundt et al. (1977) study is difficult to interpret as this study is the only report of lung pathology in animals exposed to trans-1,2-DCE, a small number of animals were examined, several of the controls also developed this effect, and the upper respiratory tract was not examined for pathology."

"For each of the exposure durations, there was no statistically significant difference between the controls and the exposed groups with respect to the incidence of liver effects (fat accumulation). In general, however, the incidence and severity of fat accumulation increased with increasing exposure duration. Although Freundt et al. (1977) reported histopathologic changes in the liver of rats, the DuPont (1998) study did not corroborate the Freundt et al. (1977) study findings. DuPont (1998) reported relatively small increases in relative and absolute liver weight (1–8%) and no gross or microscopic changes of the liver attributable to trans-1,2-DCE at an exposure concentration 20-fold higher than that

used in the Freundt et al. (1977) study. NTP (2002a) similarly found no histopathologic changes in the liver when trans-1,2-DCE was administered for 90 days by the oral route at dietary concentrations as high as 50,000 ppm. In light of the results of DuPont (1998) and NTP (2002a), it is difficult to explain the liver findings in the single-exposure concentration study by Freundt et al. (1977). Given the limitations of the Freundt et al. (1977) study (i.e., small sample size, use of only one exposure concentration, and observation of fatty accumulation in the liver lobules and Kupffer cells in control animals at some exposure durations) and lack of corroboration from other studies, the Freundt et al. (1977) study was not used as the basis for deriving an RfC for trans-1,2-DCE."

"In summary, the available inhalation data from DuPont (1998) and Freundt et al. (1977) were considered insufficient to support reference value derivation and, therefore, an RfC for trans-1,2-DCE was not derived."

Current practice by the PPRTV Program states that once an IRIS assessment becomes available for any given chemical, the PPRTV assessment for that chemical is removed from the PPRTV electronic library. Thus, based on this practice and the rationale outlined above, it is recommended that the conclusions presented in the IRIS assessment for *trans*-1,2-DCE be presently adhered to, and the *trans*-1,2-DCE PPRTV assessment has been removed from the electronic library. Any additional questions regarding *trans*-1,2-DCE should be directed to the IRIS Hotline at (202) 566-1676 or http://www.epa.gov/iris/contact_hotline.htm.

Exhibit 5

Technical Memo

Toxicity value for inhalation of trans-1,2-dichloroethylene (CASRN 156-60-5)

Prepared by Dr. Deborah Gray PhD., Stantec

April 22, 2022

In September 2010, the U.S. EPA Integrated Risk Information System (IRIS) published a chronic oral reference dose (RfD) of 0.02 mg/kg-day for trans-1,2-dichloroethylene (TDCE, CAS number 156-60-5). U.S. EPA IRIS summarized the available inhalation toxicity database for TDCE and concluded that the data were not sufficient to support development of an inhalation RfC at that time. The original IRIS summary is available at https://cfpub.epa.gov/ncea/iris2/chemicalLanding.cfm?substance_nmbr=314. The U.S. EPA Toxicological Review of cis-1,2-Dichloroethylene and trans-1,2-Dichloroethylene can be accessed at https://cfpub.epa.gov/ncea/iris/iris_documents/documents/toxreviews/0418tr.pdf. The agency did not publish inhalation reference concentration (RFC) for TDCE.

The Water Gremlin facility transitioned from trichloroethylene (TCE) to TDCE under agreements with the state in 2019. In the absence of an RFC for TDCE, the Minnesota Pollution Control Agency (MPCA) requested that the Minnesota Department of Health (MDH) develop site-specific Risk Assessment Advice (RAA) for concentrations of TDCE in ambient air to be incorporated into permit limits for the Water Gremlin facility. In 2019, the MDH published a chronic inhalation health benchmark for TDCE of 70 ug/m3. This value was based on an ingestion-to-inhalation (route to route) extrapolation from the U.S. EPA chronic oral RfD.

In May 2020, MDH published an updated RAA for TDCE establishing a sub-chronic inhalation health benchmark of 200 ug/m3 and a chronic inhalation benchmark of 20 ug/m3. The updated RAA was based on route-to-route extrapolation using a chronic oral RfD of 0.005 mg/kg-d derived in 2018 by California OEHHA. Both the U.S. EPA IRIS chronic oral RfD of 0.02 mg/kg-day and the 2018 OEHHA chronic oral RfD of 0.005 mg/kg-day were derived using data from the same sub-chronic oral dosing study (key study) with mice conducted by Shopp e.t al. (1985). The difference in chronic oral RfD values derived by U.S. EPA IRIS and OEHHA is explained by the selection of dose-response assumptions available in the U.S. EPA Benchmark Dose (BMD) modeling software. It should be noted that as of April 2022 U.S. EPA IRIS has not revised the BMD used to derive the chronic oral RfD of 0.02 mg/kg-day.

In September 2020, the U.S. EPA Superfund Program published a Peer-Reviewed Provisional Toxicity Value (PPRTV) chronic and sub-chronic provisional inhalation RfCs (p-RfC) for TDCE of 40 and 400 µg/m3. The chronic p-RfC value was used with standard default exposure assumptions to derive a residential Regional Screening Level (RSL) of 42 µg/m3. The residential RSL is intended to be protective of child and adult exposed to that concentration 24 hours/day, 350 days/year, for 26 years. The residential inhalation RSL for TDCE was first published in the November 2020 U.S. EPA RSL Tables.

The p-RfC and U.S. EPA residential inhalation RSL were derived from inhalation toxicity data and can be used and better reflect health benchmarks for TDCE emissions limits for the Water Gremlin facility. The RAAs established by MDH in 2019 and 2020 were derived from oral RfDs, but without discussion of the toxicological basis supporting a route-to-route extrapolation. In contrast, the September 2020 PPRTV[1] evaluated available studies and summarized potentially relevant noncancer data to evaluate potential points of departure for calculating inhalation RfCs for TDCE. Based on a 1998 study with a critical effect

[1] https://cfpub.epa.gov/ncea/pprtv/recordisplay.cfm?deid=349934F

of decreased lymphocyte counts, the screening subchronic p-RfC was set at 400 ug/m3 and the screening chronic p-RfC was set at 40 ug/m3.

Since the p-RfC and residential inhalation RSL are derived from the U.S. EPA expertise and risk assessment methodologies based on the specific and direct exposure pathway (inhalation rather than oral-to-inhalation extrapolated conversion), the U.S. EPA residential RSL for TDCE is the applicable and appropriate benchmark.

Deficiencies of Route-to-Route Extrapolation

The MDH RAA relied upon route-to-route extrapolation to derive an inhalation value from an ingestion value. In the case of TDCE, route-to-route was not appropriate, especially as inhalation studies for TDCE had been conducted. The IRIS database contains a evaluations for an oral RfD, inhalation RfC, and carcinogenicity, last updated 9/30/2010. The IRIS oral RfD value is 0.02 mg/kg/day. EPA evaluated available inhalation studies and considered them insufficient to support the derivation of an RfC. A previous value of 60 ug/m3 from the PPRTV database was removed in 2014 due to practice that once an IRIS assessment becomes available, as it did in 2010, the older 2006 PPRTV assessment would be removed.[2]

EPA published its Soil Screening Guidance with Appendix B[3]: Route-to-route extrapolation of inhalation benchmarks. Route-to-route extrapolation can be useful, but has important caveats, such as an assumption that the route of administration is irrelevant to the dose delivered to a target organ, "an assumption not supported by the principles of dosimetry or pharmacokinetics." Additionally, "Chemical-specific route-to-route extrapolations should be accompanied by a complete discussion of the data, underlying assumptions, and uncertainties identified in the extrapolation process. Extrapolation methods should be consistent with the EPA guidance presented in Methods for Derivation of Inhalation Reference Concentrations and Application of Inhalation Dosimetry."

In EPA's document *Methods for Derivation of Inhalation Reference Concentrations and Applications of Inhalation Dosimetry*[4], it explicitly states that:

> Oral data should not be used for route-to-route extrapolation in the following instances:
>
> (1) when groups of chemicals are expected to have different toxicity by the two routes;
>
> for example, metals, irritants, and sensitizers;
>
> (2) when a first-pass effect by the respiratory tract is expected;
>
> (3) when a first-pass effect by the liver is expected;
>
> (4) when a respiratory tract effect is established, but dosimetry comparison cannot be
>
> clearly established between the two routes;
>
> (5) when the respiratory tract was not adequately studied in the oral studies; and

[2] https://semspub.epa.gov/work/03/2218741.pdf
[3] https://semspub.epa.gov/work/11/175214.pdf
[4] https://www.epa.gov/sites/default/files/2014-11/documents/rfc_methodology.pdf

(6) when short-term inhalation studies, dermal irritation, in vitro studies, or characteristics of the chemical indicate potential for portal-of-entry effects at the respiratory tract, but studies themselves are not adequate for an RfC development.

In the case of TDCE, the respiratory tract was not adequately studied in the oral studies and short-term inhalation studies indicated potential for portal-of-entry effects at the respiratory tract. Therefore, MDH should not have used route-to-route extrapolation in the first place to derive an inhalation benchmark. Regardless, any rationale for undertaking a route-to-route extrapolation was rendered moot once US E.P.A. published the inhalation PPRTV.

Application of the Updated PPRTV

The conclusion that the PPRTV RfC is an appropriate standard is reinforced by the fact that EPA has already been using the updated toxicity value in their Regional Screening Level generic tables[5]. The November 2021 tables show the RfC as 4.0E-2 mg/3 and the resident air screening level as 42 ug/m3 based on default exposure factors. Since the PPRTV is a more relevant and recent value, is based on an inhalation study instead of oral ingestion, and is being used by EPA, MDH and MPCA must update their RAA and use the PPRTV value in risk assessment and permitting work, including for Water Gremlin.

Impact of Updated Tox Value

MPCA's Risk Assessment Screening Spreadsheet (RASS) combines default or refined air dispersion characteristics for a facility with emissions data and health based toxicity values to calculate screening level noncancer hazard and cancer risk levels. The ratio of an expected air concentration (ug/m3) to an RfC or screening level (ug/m3) is a unitless hazard quotient. The sum of hazard quotients from different chemicals and endpoints is a hazard index. According to Minnesota Statute 4717.8600[6], subpart 3c, "A hazard index of one or less indicates a combined concentration of chemicals unlikely to cause an adverse health effect to the general public." Based on MPCA guidance, risk assessments are entitled to one significant digit due to the estimation and uncertainty that surrounds the generation of toxicity values and estimations of dose. The RASS has this assumption included in its Summary tab, where the calculated risk in row 7 is compared to the guidance level in row 8 and both use one significant digit. The logic built into the formulae to determine whether the result receives an "OK" or "REFINE" flag compares the calculated risk to 1.49, which rounds down to 1.

Using the RfC of 40 ug/m3, which is conservative because it does not take into account the reduced exposure duration to residents or others in the area of the facility, if emissions from the coating rooms (STRU 73) were 100 tons per year, the total chronic noncancer hazard index would be one and, as stated in Minn. Stat 4717.8600 subp. 3c, the facility's emissions are unlikely to cause an adverse health effect to the general public.

Emissions of 100 tons per year from STRU 73 were calculated to produce a maximum annual concentration using five years of meteorological data from a nearby airport of 50.2 ug/m3. As this is above the 40 ug/m3 RfC, a secondary evaluation of the potentially affected target organ designated as blood/hematological yields a hazard quotient of 1.3, which is above 1.0. If the objective is to limit emissions to meet a hazard quotient of 1.0 or less, coating room emissions of 76 tons per year would be the applicable permit limit if the chronic level review is applied.

Technical White Paper

Response to the Minnesota Department of Health's July 13, 2022, memorandum to the Minnesota Pollution Control Agency Regarding the MDH 2020 Risk Assessment Advice (RAA) for Trans-1,2-dichloroethylene

Prepared by Dr. Deborah Gray PhD., DABT, Stantec Consulting Services, Inc.

August 19, 2022

At the request of outside legal counsel for Water Gremlin, Stantec Consulting Services, Inc. (Stantec) reviewed the July 13, 2022, memorandum from James Kelly, Manager, Environmental Assessment and Surveillance Section, Minnesota Department of Health (MDH) to Kari Palmer, Manager, Air Assessment Section, Minnesota Pollution Control Agency (MPCA). The MDH memorandum indicates it was prepared as a follow-up to the MDH 2020 Risk Assessment Advice (RAA) for trans-1,2-dichloroethylene (TDCE). Water Gremlin previously questioned the scientific and technical basis for the MDH subchronic (200 $\mu g/m^3$) and chronic (20 $\mu g/m^3$) RAA concentrations of TDCE that MPCA subsequently relied upon to develop permit limits for Water Gremlin's air emissions and usage of solvent at their facility in White Bear Township. See, Stantec's Technical Memorandum submitted to the MPCA on April 22, 2022, incorporated herein by reference. The overarching technical issue is MDH's insistence on using toxicity values from an oral drinking water study to calculate a RAA concentration for TDCE in ambient air, rather than adopting an existing Provisional Peer Reviewed inhalation toxicity value (PPRTV) published by EPA that is directly relevant to evaluating exposure to concentrations of this chemical in ambient air. As detailed in their July 2022 memo to MPCA, in addition to entirely irrelevant comments regarding alleged past facility emissions of TCE to the community, the MDH rationale for not adopting the EPA inhalation reference concentration for setting air emissions limits for the Water Gremlin facility has numerous technical flaws and inconsistencies. The purpose of this White Paper is to provide a detailed discussion of Water Gremlin's concerns with the scientific basis for the MDH RAA and to address qualitative arguments presented by MDH to further support their decision. We have organized this White Paper to align with the major scientific and technical issues identified in Water Gremlin Company's Petition for a Contested Case Hearing Pursuant to Minn. Stat. Ch. 14 and Minn. R.7000.1800 and 7000.1900.

Issues of Fact Regarding the Validity of the MDH RAA

There is no dispute that the relevant exposure pathway for the Water Gremlin facility is through inhalation TDCE from the ambient air. However, as described below, MDH calculated the RAA for TDCE in ambient air for MPCA use in Water Gremlin's permit based on oral toxicity values (oral RfD) published by EPA (2010) and California EPA Office of Health Hazard Assessment (OEHHA, 2018). MDH used a method referred to as "route-to-route extrapolation" to convert a dose from ingestion to an air concentration. In 2019 and early 2020, there was no established reference concentration (RfC) for inhalation exposures to TDCE in air. However, in September 2020, before the MPCA issued the draft permit for Water Gremlin, EPA published screening level PPRTV reference concentrations (p-RfC) of 400 $\mu g/m^3$ for subchronic and 40 $\mu g/m^3$ for chronic exposures. It is Water Gremlin's contention that the EPA (2020) PPRTV p-RfC for subchronic and chronic RfCs of 400 $\mu g/m^3$ and 40 $\mu g/m^3$, respectively is the

relevant and defensible basis for incorporation into the facility's air emissions permit since these values were derived from an inhalation exposure study and is directly applicable to ambient air.

Method Used by MDH to Develop the RAA for Trans-1,2-Dichloroethylene

The MDH document *Health Based Guidance for Air, Toxicological summary for: trans-1,2-dichloroethylene* (MDH, 2020a) outlines their method to develop the Risk Assessment Advice (RAA) value for MPCA to use in the air emissions permit for the Water Gremlin facility. A companion document, *Water Gremlin Health Assessment Series. Trans-1,2-Dichloroethylene in Air and Health* (MDH, 2020b) describes how MDH developed RAA values at the request of MPCA to be used in the air emissions permit for Water Gremlin, and MDH conclusions about possible health risk.

MDH developed two RAA values for TDCE. The first RAA developed in January 2019 established a chronic RAA for TDCE of 70 µg/m^3 (the implied but not stated subchronic standard would be 700 µg/m^3). In April 2020, MDH replaced their previous RAA with new subchronic and chronic RAA concentrations for TDCE of 200 µg/m^3 and 20 µg/m^3, respectively. Both the 2019 and 2020 RAA values were derived from an oral reference dose (RfD) using the following formula for route-to-route extrapolation found in EPA (1996) *Soil Screening Guidance: Technical Background Document*. May. EPA/540/R95/128. The 2019 RAA was derived from the chronic oral RfD of 0.02 mg/kg-d currently posted on EPA IRIS (2010); the 2020 RAAs were derived from subchronic and chronic oral RfDs of 0.05 mg/kg-d and 0.005 mg/kg-d, respectively published by Cal-EPA OEHHA (2018).

RfC = RfD (mg/kg-d) x (70 kg/20m^3) x (1000 µg/mg)

Where:

RfC – inhalation Reference Concentration in µg of chemical/m^3 of air

RfD – oral Reference Dose in mg of chemical/kg body weight per day

70 kg – body weight of an adult human

20 m^3 – assumed volume of air breathed by an adult human every day

1000 µg/mg – conversion from mg to µg

Both the EPA IRIS (2010) oral RfD and the CalEPA OEHHA (2018) oral RfD that MDH used in their route-to-route calculation of RAA concentrations in 2019 and 2020 (MDH 2020a) come from the EPA (2010) review of the toxicology database for TDCE (and cis-1,2-DCE) in support of information on IRIS. EPA identified a subchronic (90-day) drinking water study with mice (Barnes et al. 1985; and Shopp et al., 1985) that was adequate to support derivation of an oral RfD for TDCE. In this two-part study, male and female mice were exposed to TDCE in drinking water for up to 90 days (90 days is considered a subchronic exposure in rodents because it is less than the average lifespan of most rats and mice – approximately 2 years). The doses of TDCE for male mice were 0 (controls), 17, 175, and 387 mg TDCE per kilogram body weight of the animals per day (mg/kg-d). The doses for female mice were 0 (controls), 23, 224, and 452 mg/kg-d. Barnes et al. 1985 as cited in EPA (2010) reported on the study design and measurements of body and organ tissue weights, and standard parameter values in blood.

In the second part of the study Shopp et al. 1985, as cited in EPA (2010), conducted a set of three commonly used tests of humoral immune response in the mice following 90 days of exposure to TDCE in drinking water: 1) number of Antibody Forming Cells (AFCs) in the spleen following a challenge with sheep red blood cells (sRBCs); 2) hemagglutinin titers in response to sRBCs; and 3) spleen cell response to B cell mitogen lipopolysaccharide (LPS). This battery of tests involves administering sRBC (foreign antigen) to the live animals after exposure to TDCE ended, waiting 4-5 days, sacrificing the animals, and examining cells from the spleens. Responses in the TDCE treated mice were compared to responses in the control animals (dose = 0). A decrease in AFCs/number of spleen cells following sRBC challenge compared to controls was the most sensitive treatment-related effect identified from this two-part study. Furthermore, only male mice had fewer AFC/number of spleen cells compared to controls. There were no significant differences in female mice compared to controls even though TDCE dose levels for the females were higher than for the males.

It should be noted that the candidate studies reviewed by EPA (2010) included different protocols and end points. EPA (2010) selected the Shopp et al. 1985 mouse drinking water study as the basis for deriving an oral RfD because the response to sRBC challenge in male mice was the most sensitive response identified at the lowest dose level among the candidate studies. The oral RfD (0.02 mg/kg-d) published on IRIS (September 2010) was derived from Shopp et al. (1985) using the EPA Benchmark Dose Technical Guidance (EPA, 2000) and BMDS software (versions 1.4.1 and 2.1.1) available at that time.

The *Summary of Guidance Value History* MDH (2020a) explains their decision to use the CalEPA OEHHA (2018) oral RfD as the basis for their revised route-to-route extrapolation of the RAA. CalEPA was critical of the benchmark dose modeling techniques used by EPA (2010) to derive the chronic oral RfD for TDCE of 0.02 mg/kg-day currently listed on the EPA IRIS webpage. MDH's summary of OEHHA (2018) criticisms of the dose-response model used by EPA in 2010 is not particularly enlightening, but references updates to EPA guidance for benchmark dose modeling and evolution of benchmark dose software models (BMDS). As stated above, the oral RfD currently on IRIS (EPA, 2010) was derived from the Shopp et al. 1985 data using the benchmark dose modeling tools available at that time. Since 2010, EPA has issued an updated technical guidance (EPA, 2012) and selection of BMDS software models. CalEPA OEHHA (2018) used newer versions of BMDS than presented by EPA in 2012 to re-evaluate the same data from the Shopp et al. 1985 drinking water study. This resulted in a revised chronic oral RfD of 0.005 mg/kg-d.

A Note about Benchmark Dose and Benchmark Dose Modeling Software

For some data sets with multiple dose levels and subjects per dose level, the Point of Departure (POD) for subsequent derivation of non-cancer toxicity factors such as the oral RfD and inhalation RfC can be estimated using threshold dose-response models. EPA defines the Benchmark Dose (BMD) as "*an exposure due to a dose of a substance associated with a specified low incidence of risk, generally in the range of 1% to 10%, of a health effect; or the dose associated with a specified measure or change of a biological effect*." The selection of Benchmark Dose Software (BMDS) models continues to evolve to accommodate different study designs and variables. EPA's BMDS webpage provides easy access to numerous dose-response models that the user may select from and/or compare, to make predictions about the quantitative relationship between the dose or exposure of a chemical or chemical mixture associated with a given response level.

The fact that BMDS models are continually evolving provides important context to understand CalEPA OEHHA (2018) critique of the EPA (2010) oral RfD for TDCE as summarized by MDH (2020a). This will become important as EPA itself would later apply updated BMDS software to derive the PPRTV.

Limitations of MDH Use of Route-to-Route Extrapolation to Derive Inhalation Toxicity Values from Oral Toxicity Values

There are two major routes by which chemicals in the ambient or personal environment get into a person's body: oral – (1) ingestion of the chemical in drinking water, food or non-dietary items such as soil that are absorbed through the gastrointestinal tract; and (2) inhalation – breathing the chemical into the respiratory tract. Dermal absorption through the skin can also occur but generally contributes less to human exposures from environmental media than inhalation or ingestion and is not relevant to the issues at hand. The same chemical may cause different types of health effects, or the effects may occur at higher or lower levels depending on the route of exposure. Thus, it cannot be assumed that the dose-response relationship of a chemical from inhalation is comparable to that from ingestion. Therefore, **it is always more technically defensible to evaluate inhalation exposure to chemicals in the air using toxicity values derived from inhalation studies, and ingestion exposures using toxicity values derived from oral dosing studies.**

There may be situations where the toxicology and health effects database for a chemical may not support derivation of toxicity values for both the oral and inhalation routes of exposure, and in that event, there may be circumstances in which route-to-route extrapolation is unavoidable. In the Soil Screening Guidance, EPA (1996) acknowledged that inhalation toxicity benchmarks may not be available on IRIS for some of the common contaminants found at Superfund Sites and lays out limitations and guidelines where route-to-route extrapolation may be used to calculate screening levels. See Section 2.1.4 Route-to-Route Extrapolation and APPENDIX B Route-to-Route Extrapolation of Inhalation Benchmarks of the Soil Screening Guidance (EPA 1996) for a more detailed discussion. However, note EPA's important caveats for extrapolated inhalation benchmarks.

> "*…the extrapolated inhalation SSL values are not intended to be used as generic SSLs for site investigations; the extrapolated inhalation SSLs are useful in determining the potential for inhalation risks but should not be misused as SSLs.* ***The extrapolated inhalation benchmarks, used to calculate extrapolated inhalation SSLs, simply provide an estimate of the air concentration (µg/m3) required to produce an inhaled dose equivalent to the dose received via oral administration, and lack the scientific rigor required by EPA for route-to-route extrapolation. Route-to-route extrapolation methods must account for a relationship between physicochemical properties, absorption and distribution of toxicants, the significance of portal-of-entry effects, and the potential differences in metabolic pathways associated with the intensity and duration of inhalation exposures.*** *… The document, entitled Methods for Derivation of Inhalation Reference Concentrations and Application of Inhalation Dosimetry (U.S. EPA, 1994d), presents methods for applying inhalation dosimetry to derive inhalation reference concentrations and represents the current state-of-the-science at EPA with respect to inhalation benchmark development. The fundamentals of inhalation dosimetry are presented with respect to the toxicokinetic behavior of contaminants and the physicochemical properties of chemical contaminants."*

As referenced in the Soil Screening Guidance (EPA 1996) quoted above, Methods for Derivation of Inhalation Reference Concentrations and Application of Inhalation Dosimetry (EPA 1994) further elaborates on the data requirements and limitations of extrapolating inhalation toxicity values from oral exposure data. Section 4.1.2 Route-to-Route Extrapolation states:

> *"When the data base for a given chemical is not adequate via inhalation, route-to-route extrapolation is often practiced by some risk assessors using empirically derived factors that are not necessarily applicable to the case at hand. For most route-to-route extrapolations, the lack of data, lack of ability to interpret data, and underutilization of existing data due to insufficient models and statistics* ***reduce or eliminate the validity of these extrapolations****" (emphases added.)*

EPA further stated:

> "*Oral data should not be used for route-to-route extrapolation in the following instances:*
>
> *(1) when groups of chemicals are expected to have different toxicity by the two routes: for example, metals, irritants, and sensitizers*
>
> *(2) when a first-pass effect by the respiratory tract is expected*
>
> *(3) when a first-pass effect by the liver is expected*
>
> *(4) when a respiratory tract effect is established, but dosimetry comparison cannot be clearly established between the two routes*
>
> *(5) when the respiratory tract was not adequately studied in the oral studies; and*
>
> *(6) when short-term inhalation studies, dermal irritation, in vitro studies, or characteristics of the chemical indicate potential for portal-of-entry effects at the respiratory tract, but studies themselves are not adequate for an RfC development."*

These limitations readily apply to the MDH's use of oral to inhalation route-to-route extrapolations for TDCE. Although MDH acknowledges the uncertainties in route-to-route extrapolation, nowhere in their analysis do they provide a discussion that any of the critical information requirements set out in the EPA guidance documents (EPA 1994 and 1996) have been considered and addressed. Consequently, the use of their extrapolated TDCE RAA values for enforceable standards in Water Gremlin's air emissions permit is not supported by adequate data or reasoning.

Material Issues of Fact as to Whether the EPA TDCE PPRTV Provides a Superior Benchmark for Setting Water Gremlin Permit Limits to the MDH RAA

When EPA performed their toxicological review of cis and TDCE in 2010, they determined that the inhalation toxicology database was not adequate to support derivation of a Reference Concentration (RfC) under the requirements of the IRIS program. In 2020, EPA re-visited the inhalation toxicology database for TDCE and identified a 90-day subchronic inhalation study with male and female rats (DuPont/Kelly 1998) that was relevant for derivation of Provisional Peer Reviewed Toxicity Value (PPRTV) screening level subchronic and chronic RfCs of 400 µg/m^3 and 40 µg/m^3, respectively. The critical effect from the key study (DuPont/Kelly 1998) was a dose-related decrease in white blood cells

(leukocytes), also potentially related to an immune system response to the exposure. As stated by EPA (2020).

> *"The benchmark concentration lower confidence limit 1 SD (BMCL1SD) (HEC) of 109 mg/m3 for decreased lymphocyte counts in males at Day 90 from the subchronic-duration rat study (Kelly, 1998) is the lowest candidate POD in the available inhalation toxicity database for trans -1,2-DCE. In summary, Kelly (1998) is selected as the principal study because it identified the most sensitive POD and was adequate in experimental design and protocol. However, because the study was not peer reviewed, screening-level p-RfC values were derived for trans-1,2-DCE in Appendix A, in lieu of p-RfC values."*
>
> *"As discussed in the main body of the report, Kelly (1998) was an adequately designed subchronic study that evaluated several endpoints following exposure to three concentrations of trans-1,2-DCE. This study was chosen as the principal study and the corresponding benchmark concentration lower confidence limit 1 standard deviation (BMCL1SD) human equivalent concentration (HEC) of 109 mg/m3 for decreased lymphocyte counts in male rats was identified as the most sensitive point of departure (POD) for deriving screening-level p-RfC values. The observed leukopenia in rats (decreased white blood cell [WBC] and lymphocyte counts) was determined to be treatment related and suggests potential effects on the immune system. The critical effects for deriving a chronic oral reference dose (RfD) were based on altered immune function in mice (U.S. EPA, 2010), which provide additional evidence to suggest that trans-1,2-DCE targets the immune system. The Kelly (1998) study used whole-body inhalation exposure for compound administration; therefore, additional exposure through the gastrointestinal tract due to grooming is possible. This potential source of uncertainty cannot be quantified based on the available information. As a conservative estimate, the identified critical effects are assumed to be mostly due to inhalation exposure."*

EPA (2020) derived the current screening level p-RfC for TDCE using the data from the Kelly (1998) inhalation study with rats consistent with the most recent EPA BMD Technical Guidance (EPA 2012) and using BMDS version 3.1 to model benchmark concentrations. As noted previously, dose-response datasets may have different characteristics depending on study design and outcomes being measured. One size does not fit all when it comes to dose-response models. The BMDS version 3.1 dose response model that provided a good fit to the data from the Kelly (1998) inhalation study was not available at the time of EPA's 2010 toxicological review and derivation of the oral RfD for IRIS.

It is unclear why MDH readily adopted the OEHHA (2018) oral RfD, which was based on updated BMDS software, as the basis for extrapolating their May 2020 subchronic (200 µg/m^3) and chronic (20 µg/m^3) RfCs for TDCE, but chose to disregard EPA's analogous use of updated BMDS models to derive subchronic and chronic PPRTV p-RfCs from the Kelly (1998) inhalation study (EPA 2020).

In their July 22, 2022, memo, MDH relies almost entirely on the discussion of inhalation studies in EPA (2010) to discount the Kelly (1998) study as an inferior and unreliable basis for

derivation of a RfC. MDH also asserts that the Kelly (1998) study is inferior to the Shopp et al. 185 drinking water study because the former did not perform specific assays to evaluate the effects of TDCE on the immune system. There are two fallacies in this argument by MDH.

1) When EPA conducted their toxicological review in 2010, they compared the available inhalation studies back to a subchronic inhalation study conducted by Freund et al. 1977 (as cited in EPA 2010) which reported fatty changes in the livers of female rats. The Freundt study had significant design limitations such as a single TDCE exposure concentration and small number of animals. It should be noted that the PPRTV derived from this study (EPA 2006) was subsequently withdrawn from the electronic library (EPA 2014), triggering MDH's stated concern that the current PPRTV (EPA 2020) could be withdrawn in the future. EPA (2010) did not further consider the Kelly 1998 study because it did not corroborate the liver toxicity reported by Freundt – not because the Kelly study was poorly designed.

2) The fact that Kelly 1998 did not include specific immune system assays does not make it inferior to Shopp et al. 1985 or disqualify it as the basis for deriving a RfC. Each candidate study is evaluated on its own merits and findings. The accepted protocol is to identify the key study (based on design and quality) and the critical effect that was observed at the lowest dose compared to the controls. As stated clearly by EPA (2020) the Kelly 1998 subchronic rat inhalation study meets those requirements.

We know of no reason why EPA's (2020) re-evaluation of the inhalation toxicity database for TDCE under the PPRTV program would not be a more relevant and scientifically defensible basis for MDH RAA than extrapolation from an oral dosing study.

The screening level inhalation p-RfC is the relevant and technically defensible concentration for use in the air permit for Water Gremlin.

Sequential Exposure to TCE Followed by TDCE

MDH states the community near Water Gremlin was exposed to TCE emitted by the facility for years prior to Water Gremlin eliminating use of TCE and switching to TDCE; and the *"TDCE exposure may be cumulative of the TCE exposure because both are industrial chlorinated solvents*." This is an overly broad statement with no basis in the health effects literature. MDH does not offer any human or laboratory animal studies, comparison of toxicokinetics or mode of action or epidemiological data that would support this speculation. Neither TCE nor TDCE bioaccumulate and both are quickly metabolized and excreted through the lungs and kidneys. Moreover both have a relative short half-life in air (5 to 12 days for TDCE and 7 days for TCE). MDH does not provide evidence or discussion as to how the low levels of TDCE measured in the air at the Water Gremlin facility ambient monitoring locations increase the inferred risk from previous air emissions of TCE. In fact, in their April 2022 Water Gremlin Public Health Assessment: Public Comment Draft, MDH concludes that "*past or current t-DCE …air emissions are not expected to harm people's health.*" Thus, their own evaluation appears to contradict any statements regarding sequential exposure.

COVID-19 May Exacerbate the Effects of TDCE Exposure

Considering the conclusion of no past or current harm to people's health from TDCE, it is difficult to understand the origin of this MDH speculation. MDH does not present evidence specific to potential interactions between TDCE (or closely related chemicals) and any aspect of COVID-19 transmission or severity of disease outcomes. The articles MDH references are general in nature and more relevant to the distribution of ubiquitous air pollutants such as nitrogen oxides and population density. The studies MDH references in their July 13, 2022, memo to MPCA were available prior to publication of their April 2022 Water Gremlin Public Health Assessment: Public Comment Draft. If this was a genuine concern, why did MDH not include a discussion? Such a statement would of course apply to all similar chemicals in air, which in theory should prompt revision of emission limits for all facilities using similar chemicals in their industrial processes.

Public Health would be Protected

Water Gremlin disagrees with MDH's numerous arguments that public health would not be protected if the screening level p-RfC (EPA 2020) was the basis for air emissions limits for TDCE rather than the MDH RAA extrapolated from the CalEPA OEHHA (2018) revised oral RfD. There is no rational or scientific basis for this conclusion. EPA considers p-RfCs to be appropriately protective of public health and uses these values in risk assessments at sites all over the country.

At one point in their July 13, 2022, memo MDH noted that a previously published inhalation PPRTV (EPA 2006) RfC value was withdrawn from the electronic library in 2014 because the EPA (2010) toxicological review concluded that the key study (an inhalation study with rats conducted by Freund et al. 1977 as cited by EPA (2010)) was not adequate to support derivation of an inhalation RfC. MDH expressed concern that the current (EPA 2020) PPRTV inhalation value could be withdrawn at some time in the future. This is unhelpful. One could as easily say that the extrapolated CalEPA data relied upon by the MDH could be withdrawn at some time in the future.

MDH implies that because their route-to-route extrapolated RAA (MDH 2020a) subchronic (200 $\mu g/m^3$) and chronic (20 $\mu g/m^3$) values for TDCE are lower than the EPA (2020) PPRTV subchronic (400 $\mu g/m^3$) and chronic (40 $\mu g/m^3$) values, that they are more protective of public health. This conclusion does not follow from the process used to develop RfDs and RfCs from the toxicology and health effects database. In addition, this assertion obscures the layers of protectiveness built into EPA's process for deriving RfD and RfC values starting with the POD from the critical effect in the key study selected to support the toxicity factors. As mentioned previously, EPA (2010 and 2020) and CalEPA OEHHA (2018) used the versions of BMDS software that best fit the data for the critical effect in the key studies to derive a POD for subsequent derivation of the oral RfD and inhalation p-RfC. In each case, the POD was adjusted downward by the application of uncertainty factors (UFs) to account for the quality of the data: UF =10 for extrapolation from a 90 day chronic study to a lifetime chronic exposure; UF = 10 extrapolation of laboratory animal data to humans; UF = 10 for variable sensitivity of members of the human population; and UF = 3 for deficiencies and gaps in the database such as lack of a multi-generation study. Both the oral RfD (EPA 2010 and OEHHA 2018) and the PPRTV p-RfC (EPA 2020) represent levels of exposure **3,000 times lower** than the lowest exposure level for the critical effect in the key animal study, the Shopp et al. 1985 mouse drinking water study and the DuPont/Kelly 1998 inhalation study with rats. MDH has not offered any data or studies to support a conclusion that the EPA PPRTV is not protective of public health.

The key difference here is that only the PPRTV p-RfC is directly relevant to inhalation of TDCE in ambient air; and therefore should be used as the basis for air emissions limits in the Water Gremlin facility permit.

Deborah Gray PhD, DABT

Principal Toxicologist
40 years of experience · Columbus, Ohio

Dr. Gray has over 30 years of experience in the areas of environmental health, toxicology and environmental epidemiology, and human health and ecological risk assessment, and is certified as a Diplomate of the American Board of Toxicology (DABT). She has a wide range of experience in government, private sector consulting, and academia, and has worked on a variety of projects in the field of environmental and occupational health. Prior to joining Stantec, Dr. Gray held positions with other environmental consulting firms, the Ohio Department of Health, the Ohio Environmental Protection Agency, and the Ohio State University (OSU) College of Public Health. She has served as an expert consultant, and testified as an expert in human health toxicology in a variety of cases. She has provided real-time consultation on exposure assessment during emergency response to releases. Dr. Gray previously held an appointment as Clinical Associate Professor in the OSU College of Public Health, Division of Environmental Health Sciences where she had primary responsibility for teaching graduate level courses in Environmental Health, Community Emergency Response, Risk Assessment, and Toxicology, and advising graduate students.

EDUCATION

PhD, Physiology and Pharmacology (Toxicology), The Ohio State University, Columbus, OH, 1990

MS, Entomology (Invertebrate Toxicology), The Ohio State University, Columbus, OH, 1977

BS, Microbiology, The Ohio State University, Columbus, OH, 1973

REGISTRATIONS

Diplomate, American Board of Toxicology, Inc., 1996-2021

MEMBERSHIPS

Member, Society for Risk Analysis

Member, Society of Toxicology

PROJECT EXPERIENCE

HUMAN HEALTH RISK ASSESSMENT

Amtrak Confidential Project | Confidential Location | 2017-Present | Project Oversight

Deb is working with the Stantec team to support Amtrak on a sensitive project involving investigation and evaluation of potential exposures to PCBs in a highly public transportation venue (2017). She contributed to the risk assessment and sampling strategy for the Remedial Investigation Work Plan and conducted a preliminary assessment of exposure to airborne PCBs in the public areas of the venue. This project is ongoing as of 2018. Deb and her team have been reviewing analytical results for PCBs in air, dust, concrete chip and ballast samples in anticipation of a preliminary risk assessment. Role: Project Oversight | Cost: Unknown | Dates involved: 04/2017-Ongoing

Arbor Hills Landfill, LLC | Michigan

Dr. Gray and her team supported Arbor Hills Landfill (BFI/Republic Services) in responding to a Notice of Violation from Michigan DEQ resulting from community complaints about odors from the landfill and concern over exposures. Stantec prepared a final report summarizing air monitoring data in March 2017.

Northrup Grumman Facility | Salt Lake City, UT

Dr. Gray and members of her team conducted a human health risk assessment for this Northrup Grumman facility that produces highly sensitive defense-related guidance systems. The HHRA involved evaluation of chlorinated solvents and metals in groundwater, soil, and indoor air (2017).

Tennessee Valley Authority Environmental Investigations | Statewide, Tennessee | 2017-Present | Risk Assessment Discipline Lead

Deb is the risk assessment discipline lead on the Stantec team supporting the Tennessee Valley Authority (TVA) in complying with the Coal Combustion Residuals (CCR) Rule and Tennessee Department of Environmental Conservation (TDEC) orders to conduct environmental investigations of their fossil plants in Tennessee. Deb and her team contributed to the development of Sampling and Analysis Plans in advance of field investigations and are currently developing Conceptual Site Models for human health and ecological risk assessment of CCR materials (primarily trace metals-arsenic, boron, lead, and selenium). Role: Risk Assessment Discipline Lead | Cost: Unknown | Dates involved: 03/2017-Ongoing

Amtrak Former Fueling Facility | Wilmington, DE

Conducted a human health risk assessment for PCBs, PAHs, and metals (arsenic) in soil at the Former Fueling Facility on the Amtrak rail yard in Wilmington, DE. (2017) The human health risk assessment is an integral part of the Focused Feasibility Study for this complex site and supports preferred management alternatives for mitigating potential pathways of exposure through strategic placement of future buildings and pavement and controlling land use.

Former Satralloy Chromium Ore Refining Site | Steubenville, OH

Dr. Gray has been the human health risk assessor/toxicologist with the team of consultants working on the former Satralloy chromium ore refining site since 2006. This site is under the jurisdiction of Ohio EPA and is owned by Freeport-McMoran. Stantec is currently (2017) a sub-consultant to Golder Associates on this project. The primary constituents of concern on this site are hexavalent chromium, arsenic and manganese.

Evaluation of Vapor Intrusion-Multiple Sites

Dr. Gray along with Stantec's subject matter expert in contaminant intrusion have evaluated the risks from solvents (including TCE) migrating from sub-surface sources to indoor air at multiple sites across the U.S. Vapor intrusion has become a common feature of projects conducted for real estate developers and major industrial clients (ongoing 2017).

Safety Data Sheets

Dr. Gray is the senior toxicology reviewer for Safety Data Sheets (SDS) that Stantec has been developing for several clients. These projects involve developing new SDS and converting MSDS to comport with the Global Harmonization System. Dr. Gray and her team have developed SDS for a variety of products including: stone and construction products; crude oil and gas from various natural reservoirs; metal finishing products; and manufacturing residuals sold as products/ingredients for other manufacturing processes.

Countywide Recycling and Disposal Facility | Risk Assessment

An exothermic reaction in the waste mass of this operating landfill caused excessive gas production and off-site odors. Dr. Gray designed and supervised the implementation of an ambient air monitoring program to evaluate exposure and potential risk associated with air emissions from this landfill near Canton, OH. The constituents of concern included volatile organic compounds (benzene), aldehydes, and dioxins/dibenzofurans. The work performed by Dr. Gray and her staff assisted Countywide in complying with Ohio EPA Director's Findings & Orders (2006 to 2014). Dr. Gray and her team prepared a summary of all community air monitoring activities in support of Countywide's request to terminate the monitoring. Ohio EPA approved Countywide's request in 2015.

Kilgore Farm / Former Manufacturing Facility** | Westerville, OH

Otterbein College owned the 11-acre property and planned to redevelop the site to residential standards as part of the college's expansion. Dr. Gray conducted a baseline human health and ecological risk assessment for this former U.S. Army explosives manufacturing facility, and developed risk-based remedial goals to be used in conjunction with land-use restrictions.

Brownfield and NPL Sites** | Various States | Risk Assessments

Principal author of the risk assessment for the Water Tower Park (formerly Coit Road) brownfield/VAP site in Cleveland, and senior risk assessor for the following projects:

-Dominion Homes - Weston Woods development on a former skeet range in west Columbus, OH.
-Former shooting range in Canal Winchester, OH that is now a residential development.
-Tower Parking Garage in Cincinnati, OH.
-Harrison Properties, Franklin County, OH.
-Granville Solvents site, Granville, OH.
-Former tannery site near Chicago, IL.
-Lexington Bluegrass Army Depot, KY.
-Ft. Rucker, KY.
-Ft. McAllister, OK.
-Rocky Flats, CO solar pads.

Clean Ohio Assistance Fund Site*

Performed VAP compliant risk assessment as part of the Phase II report for several Clean Ohio Assistance Fund sites in northern Ohio. Several of these sites had residual petroleum contamination, and one was a former MGP site in Warren, OH.

Proposed Municipal Solid Waste Landfill* | Marana, AZ | Risk Communication

Dr. Gray evaluated the potential for members of the surrounding community for exposure to waste constituents from the landfill and addressed community concerns about health effects such as cancer and birth defects in a public hearing before the Marana Town Council (2010).

FirstEnergy* | Pennsylvania | Risk Assessment

Dr. Gray assisted FirstEnergy in evaluating pathways of exposure and potential health effects from an accidental release of partially combusted coal ash from the company's Bruce Mansfield Plant. Dr. Gray prepared a written report, met with Pennsylvania regulators and participated in two community meetings.

** denotes projects completed with other firms*

Republic Services/Bridgeton Landfill, LLC | Missouri

Starting in 2012, Dr. Gray has been working with Stantec health and safety professionals to characterize constituents in landfill gas and ambient air at a closed sanitary landfill near St. Louis, Missouri (MO). Stantec was retained by Lathrop & Gage, LLP on behalf of Bridgeton Landfill. An exothermic reaction in the waste mass resulted in excess gas and leachate production subsidence and off-site odors. The objective of the project was to identify chemical constituents of an atypical odor and evaluate potential exposures to people working on the landfill and off-site receptors. Dr. Gray is currently (2017) providing expert consulting in human health toxicology to Republic Services/Bridgeton Landfill and their outside counsel Lathrop & Gage. The Stantec team conducted comprehensive sampling of landfill source gas and ambient air to assist Republic/Bridgeton in complying with the requirements of Orders issued by the Missouri Department of Natural Resources (MDNR) and the state Attorney General.

Little Blue Run, FirstEnergy* | Pennsylvania | Risk Assessment

Dr. Gray conducted a human health risk assessment to evaluate potential exposures to inorganic constituents in groundwater and surface water believed to be related to the FirstEnergy coal ash disposal pond designated as Little Blue Run. She also assisted outside legal counsel with responding to resident questions/concerns and provided senior review for an ecological risk assessment for the same disposal pond (2009-2011).

Heleva Landfill Superfund Site Vapor Intrusion Investigation | Pennsylvania | 2012 | Health Assessment

Dr. Gray evaluated findings from sub-slab and indoor air sampling conducted in private residences situated overtop of groundwater contaminated with chlorinated solvents in a small village in Pennsylvania. Her analysis integrated the findings with respect to potential sources within the homes, sources and risks associated with the same constituents in ambient air and potential contributions from vapor intrusion.

Former Manufactured Gas Plants | Michigan and Illinois | Risk Assessment

Conducted an exposure pathways evaluation for a former MGP site that is now a popular downtown recreational area in downtown Detroit. Dr. Gray and her team worked with the client, the City of Detroit and the Michigan DEQ on investigation strategies. Developed risk-based ambient air monitoring criteria to support remedial activities at a MGP site in Illinois.

Ohio EPA Multidisciplinary Board** | Ohio | Co-chair of Work Group

Dr. Gray was appointed by the director of the OHIO EPA to the Multidisciplinary Board to review the rules for Ohio's Voluntary Action Program in 2001. As Co-chair, Dr. Gray was involved in reviewing risk-based standards for the Ohio VAP. Dr. Gray also participated in the review of VAP fees in 2006 and was reappointed to the Board in 2006 for the five year technical rules review and co-chaired the work group reviewing risk assessment rules. As co-chair, Dr. Gray's responsibility was to build a consensus on technical issues related to risk assessment.

Ohio EPA Waste Management Cleanup Standards** | OH | Academic Reviewer

Dr. Gray was invited as an academic reviewer for the Ohio EPA Waste Management Cleanup Standards risk assessment harmonization project.

Coit Road and Brownfield Redevelopment Site** | Ohio VAP | Cleveland, OH

Dr. Gray was the primary author of the human health and ecological risk assessment for this former GM/Fischer Body Plant manufacturing facility. The risks assessment supported cost-effective redevelopment of this large property by the Ohio Department of Administrative Services.

Workplace Setting** | Employee Health Complaint Investigations

Directed and participated in investigations of employee health complaints in workplace setting and investigations of health complaints potentially related to residential environments.

Indoor Environmental Quality Investigations** | Principal-in-Charge

Dr. Gray and her team conducted numerous indoor environmental quality investigations, including evaluation of occupant health complaints potentially related to biological and chemical agents in the indoor environment.

Human Health Risk Assessments** | Various States | Risk Assessments

Dr. Gray has conducted and reviewed both human health and ecological risk assessments for CERCLA; RCRA; Department of Energy and Department of Defense sites; state voluntary clean up (brownfields programs in Ohio, Illinois, Michigan, Indiana, and California; and petroleum contaminated sites in Ohio. She has conducted risk assessment projects for federal, state, municipal, and private sectors' clients. Dr. Gray's specialty is in the evaluation of human health and ecosystem toxicity of chemical and radiological agents.

Toxicology of Consumer Products** | Confidential | Toxicology Assessment

Dr. Gray evaluated toxicity testing information for ingredients in horticultural consumer products including labeling recommendations (2011 to 2012).

** denotes projects completed with other firms*

Toxicologist in Residence** | Columbus, Ohio

Toxicologist in Residence for the Columbus Health Department and Program Director for the City's Environmental Science Advisory Committee (ESAC). Issues addressed included drinking water quality related to herbicides and disinfection by-products; evaluation of community exposures from an explosion at a phenol-formaldehyde resin manufacturing facility; and potential community exposures to airborne release of dioxins / dibenzofurans from the City's former waste to energy facility (1998-2004).

La Cienega Creative Properties | Los Angeles, CA | 2014-2016 | Project Oversight and Technical Support

Deb supervised and provided technical input and quality review for the screening level HHRA of multiple Areas of Concern on this large commercial property. Volatile organic compounds in groundwater and vapor intrusion were the primary concerns at this site. The site is under the jurisdiction of the Los Angeles (LA) Regional Water Quality Control Board. Role: Project Oversight and Technical Support | Cost: Unknown | Dates involved: 03/2014-05/2016

Brewer's Yard Apartments | Columbus, Ohio

Dr. Gray and her team worked with the owners of this property in downtown Columbus to address and resolve concerns raised by Ohio EPA regarding soil contamination with polynuclear aromatic compounds (PAHs) and potential vapor intrusion related to naphthalene.

Risk Assessment Consultant - Underground Storage Tanks** | Ohio | 1999-2002

Dr. Gray was retained by the Ohio Bureau of Underground Storage Tank Regulations (BUSTR) to assist in clearing their backlog by reviewing risk-based closure reports to develop recommendations and work one-on-one with BUSTR Site Coordinators to resolve issues so that numerous projects could be closed. She also provided a formal training course in the basics of toxicology and risk assessment for the BUSTR Site Coordinators.

Pacific Gas & Electric Facility | Emeryville, California | 2012-2013 | Project Oversight

Deb and her team conducted a multi-pathway human health risk assessment for this active materials handling facility in a mixed commercial and residential neighborhood. Future re-development of the property was being considered and is likely to be consistent with the surrounding neighborhood, including residential. The major constituents of concern were chlorinated solvents in groundwater and indoor vapors, and arsenic in soil. Role: Project Oversight | Cost: Unknown | Dates involved: 10/2012-12/2013

Darby Creek Tank Farm | Pennsylvania

Dr. Gray supervised and provided technical input and quality review for the human health risk assessment of three Areas of Interest on the Darby Creek Tank Farm, near Philadelphia, Pennsylvania (PA). The HHRA was prepared consistent with PA Department of Environmental Protection (PDEP) guidance on behalf of Evergreen Resources Management (2014-2017).

Petro Resources Capital | Arvin, CA | Legal Support

Dr. Gray was a member of the Stantec team supporting Petro Resources Capital and their outside legal counsel in evaluating potential exposures to residents whose homes were (reportedly) impacted by a release of wellhead gas from a nearby pipeline (2014).

Marcus Hook and Philadelphia Petroleum Refineries | Philadelphia, PA | 2015 | Health Assessment

Dr. Gray is working with the Stantec team in West Chester, PA to evaluate exposures from petroleum-related VOCs in ambient air and indoor air, and determine the potential for vapor intrusion in selected buildings on these operating refineries. The air sampling is part of the environmental investigations at both facilities.

Multiple Sites in California

Dr. Gray and her team have conducted numerous Tier 1 and Tier 2 human health risk assessments for projects of varying sizes and complexities in California. The regulatory venues have included DTSC, the San Francisco Bay Area Regional Water Quality Control Board and the Los Angeles Regional Water Quality Control Board as well as local jurisdictions. Most of the projects have addressed potential risks from residual petroleum hydrocarbons, chlorinated solvents, arsenic and residual pesticides. Several of these projects have involved Chevron sites. Pathways of exposure considered in the risk assessments include vapor intrusion, and direct contact with soil and groundwater.

Tier 1 and Tier 2 Human Health Risk Assessments | Multiple Sites, California | 2012-2018 | Project Oversight

Deb and her team have conducted numerous Tier 1 and Tier 2 human health risk assessments for projects of varying sizes and complexities in California. The regulatory venues have included DTSC, the San Francisco Bay Area Regional Water Quality Control Board and the Los Angeles Regional Water Quality Control Board as well as local jurisdictions. Most of the projects have addressed potential risks from residual petroleum hydrocarbons, chlorinated solvents, arsenic and residual pesticides. Several of these projects have involved Chevron sites. Pathways of exposure considered in the risk assessments include vapor intrusion, and direct contact with soil and groundwater. Role: Project Oversight | Cost: Unknown | Dates involved: 09/2012-11/2018

TOXICOLOGICAL ASSESSMENTS

Health Effects of Metals in Ambient Particulate | Toxicology Assessment

Collaborated with scientists at Battelle to conduct a critical review of the health impacts of metals in ambient air particulate matter under Battelle's contract with the Mickey Leland National Urban Air Toxics Research Center. Additional funding to complete the research was provided to Stantec in a contract with the Nickel Producers Environmental Research Association. The manuscript is entitled, "Respiratory and Cardiovascular Effects of Metals in Ambient Particulate Matter: A Critical Review" by Deborah L. Gray, Lance A. Wallace, Marielle C. Brinkman, Stephanie S. Buehler, and Chris LaLonde. The manuscript was published in Reviews of Environmental Contamination and Toxicology in November 2014.

LITIGATION SUPPORT AND EXPERT TESTIMONY

Patrick, Price and Hartle et al. v. FirstEnergy: Civil Actions 2:08-CV-01019-JFC; 2:08-CV-01025-JFC; and 2:08-CV-01030-JFC in the United States District Court | Western District, Pennsylvania | Expert Testimony

Testified in deposition (February 22, 2013) as an evidence witness (non-retained expert) regarding previous involvement as an expert consultant to FirstEnergy in toxicology and public health regarding releases from the Bruce Mansfield generating plant in Shippingport, PA. The plaintiffs alleged health effects resulting from exposure to metals (arsenic and thallium) resulting from an airborne release of partially combusted coal ash from the Bruce Mansfield generating plant.

John Michael Abicht et al. v. Republic Services,Inc., et al: Case No. 2008 CT 10 0741 in the Court of Common Pleas | Tuscarawas County, Ohio | Expert Testimony

Testified in deposition (January 1, 2013) as a fact witness (non-retained expert) regarding ambient air sampling and evaluation of potential community exposures re: Countywide Landfill.

Tristan Tolloty v. Republic Services, et al (Stark County, Ohio Court of Common Pleas) | Expert Testimony

Deposition as fact witness (June 18, 2012) regarding ambient air sampling in the community surrounding Countywide Landfill.

Mike Phillips, Jonna Phillips, Scott Spencer, Cassie Spencer, Jared McMicken and Heather McMicken v. Chesapeake Appalachia, LLC., Chesapeake Energy Corporation and Nomac Drilling, Inc.: Civil Action No. 3:11-MC-126 in the United States District Court. | Expert Testimony

Provided expert testimony in deposition (June 8, 2012) on behalf of the defense regarding the human health implications of methane in well water.

City of Monroe, Ohio v. Korleski et al., ERAC Case No. 096438** | Expert Testimony

This case involved appealing the final air pollution permit to install issued for Middletown Coke Company. On behalf of the plaintiff (represented by VanKley and Walker) reviewed the conditions of the PTI and produced an Expert Report regarding the potential for increased risks for health effects amongst members of the nearby community related primarily to anticipated emissions of fine particulate from the coke plant. Testified in deposition August 2011.

On behalf of the plaintiff (represented by VanKley and Walker)** | Expert Testimony

Evaluated the potential health implications of airborne emissions of fine particulate matter and mercury that would be experienced by residents in close proximity to the location of a proposed Coking facility.

Conducted review of the pharmacology and toxicology of constituents in cigarette smoke in preparation for expert witness testimony in multiple cases originating the State of Florida. Testified in deposition October 2011.

City of Monroe, Ohio v. Chris Korleski, Director of Environmental Protection, Middletown Coke Company, and Suncoke Energy, Inc. and City of Monroe, Ohio v. Middletown Coke Company, Inc., et. al.** | Monroe, Ohio | Expert Testimony

On behalf of the plaintiff (represented by VanKley and Walker) evaluated the potential health implications of airborne emissions of fine particulate matter and mercury that would be experienced by residents in close proximity to the location of a proposed coking facility. Testified in deposition August 2009.

PJ & Associates v. Patel et al., In the United States District Court for the Northern District of Georgia, Atlanta Division, Civil Action File No. 1:15-CV-02861-AT | Expert Testimony

Dr. Gray has been retained as an expert consultant in toxicology & risk assessment on behalf of one of the defendants by Thompson Hine. This case involves the alleged release of dry cleaning solvent from the defendants' property onto the adjacent plaintiff property. Dr. Gray evaluated potential pathways of exposure (including vapor intrusion) and prepared an expert report and testified in deposition on November 18, 2016. She prepared a second expert report in a subsequent CERCLA claim in this case and testified in deposition in June 2017.

Confidential Client, Worker's Compensation Claim | West Virginia | Expert Consultant

Dr. Gray was retained as a consulting expert on behalf of the defendant in a worker's compensation claim in the State of West Virginia. The plaintiff (now deceased, claim being moved forward by the widow) claimed that the hepatocellular carcinoma that resulted in his death was caused by exposure to specific chemicals at the electrical generating plant where he was employed. Dr. Gray reviewed medical records, the opinions of medical specialists retained by the defense, depositions, MSDS sheets for chemical products (as provided by the plaintiff), and conducted independent research. She concluded that the plaintiff either had no exposure or insufficient exposure to chemicals in his job duties; and that occupational exposure was unrelated to his fatal cancer (2016).

Sue Pluck et al v. BP Oil Pipeline Company (US District Court Northern District of Ohio Eastern Division, Case No. 4:08CV-1545)** | Expert Testimony

Testified in deposition (April 2009) as an expert witness for the defense regarding plaintiff's claim that exposure to benzene in her well water was the cause of her non-Hodgkin's Lymphoma. Court granted the defendant's request for summary judgment.

Republic Services Inc. v. American International Specialty Lines Insurance Company (US District court Southern District of Florida, Case No. 8:07-21991-CIV-GOLD)** | Expert Testimony

Testified in deposition (January 15, 2009) as a fact witness regarding the ambient air monitoring that was conducted on behalf of Republic Services Countywide RDF.

Countywide Recycling and Disposal Facility* | Stark County, Ohio

Principal-in-Charge and public health toxicology expert (retained by Baker & Hostetler, outside counsel for Republic Services) in Stark County, Ohio. Dr. Gray designed and supervised the implementation of an ambient air monitoring program to evaluate exposures and potential risk associated with emissions from the landfill. The work performed by Dr. Gray and her staff assisted Countywide in complying with Ohio EPA Director's Findings & Orders (2006 to 2011).

Dr. Gray continues to provide expert services to Countywide through review of on-going ambient air monitoring data collected by another consultant (2013).

Citizens Against Pollution v. Ohio Power Company (US District Court of the Southern District of Ohio, Eastern Division, Case No 2:04-CV-00371)** | Ohio | Expert Testimony

Served as expert witness in toxicology and human health for the defense. Reviewed ambient air monitoring data for sulfuric acid potentially associated with ground-level emissions from the Ohio Power (AEP) Gavin Generating Plant, and evaluated potential exposures with respect to health effects alleged by the plaintiffs. Testified in deposition January 19, 2006. The case settled out of court.

Landfill Site Air Monitoring** | Confidential | Expert Testimony

Evaluated air monitoring data for hydrogen sulfide with respect to potential health effects in a community near a landfill (2005).

Janet Braglin v. Lempco Industries (Court of Common Pleas, Case No. 01-CV-00386** | Perry County, Ohio | Expert Testimony

Served as expert witness for the plaintiff in this wrongful death suit brought by the widow of the deceased. Plaintiff's widow was represented by Fuller & Henry, Ltd. Testified in deposition on August 20, 2002 and in Daubert Hearing in March 2005.

Janet Braglin, Widow-Claimant; Andrew Braglin, Decedent v. Administrator, Bureau of Workers' Compensation et al, Case No. 02-CV-0032** | Expert Testimony

Testified in deposition on June 6, 2003 as an expert witness for the plaintiffs.

United States of America v. Ohio Edison (Federal District Court, 2003-2004)** | Ohio | Expert Testimony

Served as expert consultant on toxicology (secondary sulfate and nitrate particles) for the defense (represented by Porter, Wright, Morris & Arthur) in this litigation under the Clean Air Act.

Porter, Wright, Morris & Arthur** | Expert Testimony

Provided consulting services on an as-needed basis to attorneys at the firm on a variety of workers' compensation claims and occupational exposure cases. Services have included review of medical records to establish biologically plausible associations between injuries and alleged toxic exposures, review and interpretation of the relevant literature, review and interpretation of drug test results related to workers' compensation claims, preparation of consultant reports and testimony in deposition and at trial.

Donald Bales (deceased) v. Printing Services Company and the Ohio Industrial Commission** | Expert Testimony

Served as an expert witness in toxicology for the defendants. Testified in deposition 2001.

Ohio Public Interest Research Group v. Laidlaw** | Franklin County, Ohio | Expert Testimony

Served as an expert witness for the defense in this citizen's action suit under the Clean Water Act. Worked with local attorneys at the firm of Crabbe, Brown, Jones, Potts & Schmidt and with the Boston office of Foley, Hoag and Eliot. Deposition testimony (1997) focused on the evaluation of water quality and sediment data with regards to ecosystem toxicity, and potential impacts of metals to biota in the receiving stream. The case settled out of court.

Rossmoor Community v. Morris Company et al** | New Jersey | Expert Testimony

Provided litigation support in epidemiology and toxicology to the defendants represented by Sterns & Weinroth. This case involved the proposed construction of an electronics warehouse on property immediately adjacent to a retirement community. The community opposed the project based on allegations that the increased particulate emissions from truck traffic associated with the warehouse would negatively impact the health of the residents. Worked with air modeling expert to determine the probable nature of the exposures and implications to the health of the Rossmoor Community residents. This case settled during the early stages of the trial.

Handwell Company Third Party Cost Recovery Under CERCLA** | Columbus, OH | Expert Testimony

Provided support of the plaintiff Handwell Company in seeking relief from the former owners and operators of a small industrial property in Columbus for the anticipated cleanup of soil contaminated with lead, nickel, and chromium. Evaluated risk-based cleanup goals for the property and provided testimony in deposition 1995.

Peterman v. HARSCO** | Union County, OH | Expert Testimony

In this case, former employees of HARSCO alleged injury from exposure to the components of a paint formulation in the workplace. Worked with attorneys at Porter, Wright, Morris & Arthur to research the components of the paint, review the plaintiffs' medical records and relevant toxicology literature. Prepared exhibits and testified at trial 1994 on behalf of the defense. Jury found in favor of the defense.

Waterman v. Taylorville Sanitary District et. al.** | Christian County, Illinois | Expert Testimony

The plaintiffs' alleged damages to their health and property as a result of the application of municipal sewage sludge to an adjacent agricultural property. Provided deposition testimony (1993) on behalf of the defendants. The case settled out of court.

Marie DeSario and John Andeozzi et al v. Industrial Excess Landfill et al** | Stark County, Ohio | Expert Testimony

Worked with attorneys at Squire, Sanders & Dempsey to refute the illogical delineation of the class boundaries claimed by the plaintiffs. Provided litigation support and expert testimony at trial 1993.

Mildred Griffith et al v. Industrial Excess Landfill et al** | Stark County, Ohio | Expert Testimony

Worked with attorneys at Square, Sanders & Dempsey to evaluate the potential exposures and health effects that may have been experienced by the plaintiffs. Reviewed plaintiffs' medical records and provided testimony in deposition (1991). The case settled before going to trial.

United States of America v. Marine Shale Processors, Inc.** | Lafayette, Louisiana | Expert Testimony

Worked with attorneys from the U.S. Department of Justice (U.S. DOJ) and U.S. EPA to develop court exhibits from environmental monitoring data. Testified as an evidence witness in a pre-adjudicatory hearing 1991.

State of Ohio v. Steel Processing Services et al** | Jefferson County, Ohio | Expert Testimony

Worked with attorneys Porter, Wright, Morris & Arthur to refute allegations that fiberglass released from the defendant's rail car salvage operation caused an outbreak of (dermatitis) ailments in two nearby schools. Testified at bench trial 1990.

Confidential Client | OH

Dr. Gray was retained as a consulting expert in toxicology by the outside legal counsel for a steel manufacturer in Ohio (2013-2015).

Shook, Hardy & Bacon, LLP | Florida | Expert Testimony

Dr. Gray was retained as an expert in human health toxicology by Shook, Hardy & Bacon, LLP (outside legal counsel representing a major cigarette manufacturer). She conducted an independent review of the pharmacology and toxicology of constituents in cigarette smoke in preparation for expert witness testimony in multiple cases originating in the State of Florida. Testified in deposition October 2011.

State of Missouri v. Republic Services/Bridgeton Landfill | Bridgeton, MO

Dr. Gray has been retained as an expert in toxicology/public health by Lathrop & Gage, LLP, the outside legal counsel for Republic Services/Bridgeton Landfill, LLC.

EXPOSURE ASSESSMENT

Proposed Municipal Solid Waste Landfill** | Marana, AZ | 2010 | Risk Communication

Dr. Gray evaluated the potential for members of the surrounding community for exposure to waste constituents from the landfill and addressed community concerns about health effects such as cancer and birth defects in a public hearing before the Marana Town Council.

River Valley Local Schools** | Marion County, Ohio | 1998-2013 | Technical Advisor

River Valley High and Middle Schools were located on a contaminated property previously used by the Department of Defense. A higher than expected rate of leukemia was documented amongst River Valley graduates and the population of Marion. Dr. Gray evaluated the potential for exposure to toxic chemicals on the school campus, the etiology and risk factors for thedifferent types of leukemias reported. Participated in various public and private meetings and provided real-time advice to the school administration regarding management of perceived and actual risks to students and staff (1998-2003).

Dana Corporation** | Bellefontaine, Ohio | 2002-2003 | Risk Communication

Dr. Gray assisted Dana Corporation with an intensive risk communication effort involving the neighborhood surrounding the Dana Glacier-Daido plant in Bellefontaine, Ohio. Prior to Dana's recent acquisition, historical activities at this metal working plant released lead dust into the surrounding neighborhood, contaminating soil in residential yards.

Ohio Department of Health* (ODOH)* | Ohio | 1985 - 1990

Dr. Gray and her staff provided expertise in toxicology and environmental epidemiology to local health departments and to Ohio EPA on a wide variety of issues including the development of fish consumption advisories, suspected exposures to toxic substances in the ambient environment and in the workplace, and health effects and epidemiology investigations at Ohio NPL sites (1985-1990).

Ohio University Industrial Hygiene Program | 2008-2010 | Advisory Committee

SPILL RESPONSE

FirstEnergy Bruce Mansfield Plant Coal Ash Releases | Shippingport, PA

Dr. Gray assisted FirstEnergy in evaluating pathways of exposure and potential health effects from an accidental release of partially combusted coal ash from the company's Bruce Mansfield Plant. Dr. Gray prepared a written report, met with Pennsylvania regulators and participated in two community meetings.

Community Emergency Response Training for Public Health Students* | OH

Dr. Gray coordinated and helped to develop a practice-based training course for public health students at The Ohio State University (2002-2004).

Refugio Incident | Gaviota, CA | 2015

Dr. Gray is a member of the support team evaluating pathways of exposure for human and ecological receptors following a crude oil pipeline release along the California coast in May 2015 (ongoing in 2015).

Drovdal 18/19 Well Release Incident | Watford City, ND

Dr. Gray was a member of the Stantec team responding to an accidental petroleum release from a well under development in North Dakota. The release occurred immediately prior to Christmas in 2012 and the response continued through the winter months. Dr. Gray's role was to provide real-time consultation regarding potential community exposures during the incident and to evaluate potential exposures from residual petroleum hydrocarbons.

Miamisburg Hazardous Materials Train Wreck* | Miamisburg, OH

Deborah Gray represented the Ohio Department of Health (ODH) in responding to a phosphorous fire initiated by a train derailment near the City of Miamisburg OH in July 1986. Her role was to be present on-scene and provide real-time consultation to the local primary responders regarding likely exposures and the need for evacuation of community residents. Dr. Gray and her colleagues with the ODH also conducted surveys and evaluation of the community in the months following the incident.

Production Water/Brine Release | Williston, ND

Dr. Gray provided real-time consultation and assistance in evaluating potential human health implications from the release of oil field production water with a high brine content into Blacktail Creek, Little Muddy River and the Missouri River in Williston, ND (January-February 2015).

August 18, 2022

Bradley Hartsell,

This letter is in response to your questions on monitoring and replacement of the Nederman air filters in your facility. The Nederman collectors operate with the highest filter efficiency in the industry.

Each of the Nederman collectors at your facility operates with 3-stage filtration. Two firberbed filters and one HEPA final filter. The Nederman collectors are equipped with individual pressure monitoring gauges for each filter. When the filters are new, the gauges are in the green zone. As the filters load, the gauges will start moving up ... eventually into the red zone. When a gauge reaches the red zone, it is time to consider changing the affected filter. This does not mean you need to change all three filters.

Our recommendation for operating and maintaining the collectors is to follow the O&M manual and change out a filter when it reaches the red zone on the filter gauge. We do not recommend opening the collector, pulling the filters and inspecting them daily, as this provides no useful information, and risks filter damage.

Let me know any questions regarding the information provided.

Sincerely,

Tom Eastlack
Glacier Technology Inc.

Re: Water Gremlin Comments on Preliminary Draft Air Emission Permit No. 12300341-101

Dear Mr. Timler:

We write on behalf of our client Water Gremlin Company ("Water Gremlin" or the "Company") to provide comments on the Preliminary Draft Air Emission Permit No. 12300341-101, dated July 20, 2022 ("Draft Permit"). While the Company appreciates the agency's willingness to meet regularly with Company personnel on the Draft Permit, there remain significant unresolved factual, scientific and legal issues with the Draft Permit, as outlined in this comment letter and the attachments hereto. In particular, the Company believes that the facility limit for solvent use proposed in the Draft Permit is based on an improperly derived health benchmark and a series of compounding safety factors that are not based in fact, law, or promulgated rule and are not tied to any identified risks to the community surrounding the Water Gremlin facility. The result is a deeply flawed Draft Permit that will materially impact Water Gremlin's ability to meet demand for its essential products, which are critical for automotive, telecommunications, aviation, and military applications.[1] As a result, in addition to these comments, the Company is submitting today a Petition for a Contested Case Hearing ("Petition") regarding certain factual bases for the Draft Permit. Water Gremlin's Petition is attached as **Exhibit 1**.

Water Gremlin is committed to providing a safe and healthy environment for our employees, neighbors, and the broader community, and understands that the MPCA's mission and statutory authority aligns with those goals. In that spirit, Water Gremlin is working to transition to ultraviolet ("UV") based coating machines as part of its Gremlin Green

[1] The Company supplies products for consumers, commercial and industrial applications, government operations and military uses. The arbitrary limitations placed on the Company's operations via a permit premised on unfounded factual assumptions and unpromulgated rules and standards will significantly constrain production and could result in disruptions to critical supplies.

environmental program, which reduces the use of industrial solvents in the facility. Water Gremlin has proposed to invest heavily (capital costs of over $3 million dollars) in UV-based coating machines that would significantly reduce the use of solvents in its operations over the course of the five-year permit term. This transition would require a slightly higher allowance of emissions in the initial two years (during construction of the UV coaters) than what was proposed in the Draft Permit (but still below the Minnesota Department of Health's health benchmark), followed by a steep drop-off of solvent use, such that the overall emissions over the five-year permit term would be ***lower*** than what is allowed under the Draft Permit.

Unfortunately, the MPCA rejected this proposal and insists on imposing permit conditions and limitations that do not have a basis in fact or law. Indeed, the MPCA has said publicly that it is seeking to impose the strictest permit allowable under law. But, in their eagerness to restrict Water Gremlin's operations, the MPCA went too far – as described in this letter and the attached Petition.

The remainder of this letter and the attached exhibits provide a more detailed discussion of Water Gremlin's comments on the Draft Permit.

I. Comments on the Draft Permit

As a threshold matter, Water Gremlin notes that the Draft Permit expressly acknowledges but does *not* terminate the March 1, 2019 Stipulation Agreement signed by Water Gremlin and the MPCA ("Stipulation Agreement") and the unilateral January 17, 2020 Administrative Order issued by the MPCA ("Administrative Order"). The Stipulation Agreement and Administrative Order were put in place to provide interim regulatory requirements applicable to the Company while its application for a new facility air permit was pending. The Company has fully complied with the Stipulation Agreement and Administrative Order, including monitoring requirements and collection of data at a cost of over one million five hundred thousand dollars ($1,500,000) per year.

The MPCA's technical support document ("TSD") accompanying the Draft Permit acknowledges that all actions required by the Administrative Order to resume coating operations have been completed by the Company. Similarly, the TSD notes that Water Gremlin was required to complete all requirements of the Stipulation Agreement prior to issuance of the Draft Permit. Because Water Gremlin has either already met or will meet all of the agency's requirements upon issuance of the permit, and because there are conflicting requirements set forth in the Stipulation Agreement and Administrative Order with the terms of the Draft Permit, the Stipulation Agreement and Administrative Order must terminate upon issuance of the final permit.[2]

[2] We note that the Stipulation Agreement and Administrative Order impermissibly failed to include any termination provisions, and since Water Gremlin has complied with and completed all of the required response actions, Water Gremlin is requesting termination of these documents.

The remainder of this comment letter discusses the flawed TDCE limit incorporated in the Draft Permit, the ongoing monitoring requirements that Water Gremlin believes do not provide any additional regulatory or health benefit, and additional comments as enumerated on the comments to the Draft Permit and TSD, which are attached as **Exhibits 2- 4** herein.

A. Proposed Facility TDCE Limit

1. Background

As part of an environmental audit that the Company undertook and discussions with the MPCA, the Minnesota Technical Assistance Program at the University of Minnesota ("MNTAP"), and other resources, the Company voluntarily eliminated the use of trichloroethylene ("TCE") in its facility in January 2019 and replaced it with the recommended substitute *trans*-1,2-Dichloroethylene ("TDCE"). TDCE was recommended by MPCA and MNTAP as a safe and effective replacement for TCE. Pursuant to the Stipulation Agreement, Water Gremlin transitioned from using TCE to using the FluoSolv WS solvent, which uses TDCE as its main ingredient. TDCE is not classified as a hazardous air pollutant ("HAP") under the Clean Air Act and is far less toxic than TCE.[3]

At the time of the Stipulation Agreement, the MPCA imposed a facility-wide limit on the use of FluoSolv of 0.90 tons per calendar day, calculated as a 24-hour sum, with a 90 ton per year ("tpy") annual limit. The 0.90 tons per day limit was calculated by the MPCA based on Minnesota Department of Health ("MDH") Risk Assessment Advice ("RAA"), in which MDH determined a chronic RAA value for TDCE of 70 micrograms per cubic meter ("µg/m^3"). This value was based on an ingestion-to-inhalation ("route to route" or "RTR") extrapolation from the United States Environmental Protection Agency's ("USEPA") chronic oral reference dose for TDCE of 0.02 mg/kg-day, which was published on the USEPA's Integrated Risk Information System ("IRIS") webpage.

In May 2020, MDH published an updated RAA for TDCE with a sub-chronic inhalation health benchmark of 200 µg/m^3 and a chronic inhalation benchmark of 20 µg/m^3. The updated RAA was again based on route-to-route extrapolation using a chronic oral (not inhalation) reference dose of 0.005 mg/kg-day, taken from a 2018 assessment of oral toxicity by the California Environmental Protection Agency's Office of Environmental Health Hazard Assessment ("CalEPA") and incorrectly and improperly incorporated into the RAA.

Based on this updated MDH RAA, the first draft permit shared by MPCA with Water Gremlin, dated June 7, 2021, included a limitation on TDCE emissions of 35 tpy, using a 365-day rolling sum, to be calculated each operating day for the prior 365-day period. Subsequently, an updated draft permit provided by MPCA, dated July 29, 2021, included a limit on TDCE emissions of 40 tpy, calculated on the same rolling 365-day basis. The next two permit drafts

[3] *See, e.g.,* TDCE safety profile information such as that from 3M. 3M, "t-DCE: A safe, sustainable component in 3M Novec cleaning solutions," (June 2021), https://multimedia.3m.com/mws/media/811521O/trans-dce-trans-dichloroethylene.pdf. According to 3M, the safety profile of TDCE has been well characterized over the past 25 years.

reverted back to the 35 tpy level from the original draft permit. As discussed below, the Draft Permit now includes a limit on TDCE emissions of 32.6 tpy.

A detailed Technical Memorandum commenting on the MDH and MPCA risk assessment methodologies was prepared and submitted to the MPCA on April 22, 2022. This Technical Memorandum and a supplement thereto are attached herein as **Exhibit 5**. For the reasons set forth in the Technical Memorandum, Water Gremlin objects to the application of a 32.6 tpy limit in the Draft Permit, and the analysis regarding the risk assessment, risk factors and safety margins used to derive the limit.

The MPCA's risk assessment analysis has been arbitrarily applied to only the Water Gremlin facility. There is no basis in fact, science or the law for the TDCE limit being imposed by the MPCA. It is not based on any promulgated rule or standard, it is unsupported by substantial evidence, it is foundationally inaccurate (based on extrapolation of oral data), it is inaccurate in application (chronic vs sub-chronic) and inconsistent with the agency's own risk assessment guidance.

2. TDCE Limit in the Draft Permit

The proposed facility TDCE usage limit of 32.6 tpy in the Draft Permit was determined by applying the MDH's RAA chronic health benchmark for TDCE of 20 µg/m^3. MPCA further adjusted the emission rate downward in Water Gremlin's Screening Risk Assessment Spreadsheet ("RASS") so that the final endpoint-refined hazard index for TDCE calculates specifically to 1.0 (one significant digit), rather than rounding index readings between 1.49 and 1.00 to 1 as provided in MPCA practice. The MPCA then added an additional 16 percent safety factor to the TDCE emissions limit based on the current usage of TDCE at the facility, on the rationale that ambient air monitoring on site indicated that air dispersion modeling was allegedly under-predicting actual ambient air concentrations.

The Company believes there is no basis in fact, science or the law for the facility TDCE limit of 32.6 tpy proposed by the MPCA in the Draft Permit. Most significantly, Water Gremlin has repeatedly raised concerns about the MDH RAA for TDCE and MPCA's reliance upon it. Even though the RAA was reportedly developed to be a standard of general application, the RAA has not been promulgated into state rule. It is unsupported by any substantial evidence, it is foundationally inaccurate due to being based on MDH's improper extrapolation of oral exposure data, it is inaccurate in application of a chronic health benchmark rather than a sub-chronic, and it is inconsistent with the agency's own risk assessment guidance. These issues are discussed in turn, below.

(a) MDH RAA Health Benchmark

As noted above, the MDH RAA for Water Gremlin, which resulted in a sub-chronic inhalation health benchmark of 200 µg/m^3 and a chronic inhalation benchmark of 20 µg/m^3, was based on a RTR extrapolation of an oral reference dose to an air concentration. Attached to this letter as **Exhibit 5** are a Technical Memorandum and supplement from Dr. Deborah Gray, an

independent toxicologist at Stantec, who has significant experience in toxicology, risk assessments, and in particular TDCE. Dr. Gray describes the many reasons why the MDH RAA does not provide a reliable basis on which to derive a permit limit for TDCE, including the inherent unreliability of RTR extrapolation, the lack of transparency, and the lack of peer review of the MDH's in-house route-to-route extrapolation.

In a memorandum provided as an attachment to the TSD, MDH "acknowledges the limitations associated with RTR extrapolation."[4] MDH guidance further recognizes that sufficient toxicokinetic information must be available to support any attempted RTR extrapolation,[5] but did not provide or cite to any of the necessary documents or other resources regarding the protocols for performing RTR extrapolation. Because it is extremely difficult to perform it reliably, USEPA very seldom engages in RTR extrapolation. **The uncertainties associated with RTR extrapolation are often at least as great as the uncertainties, and magnify any limitations associated with, the underlying study on which the extrapolation is based**.

Furthermore, there was no reason for MDH to rely on an oral-to-inhalation RTR extrapolation because in September 2020, EPA established Provisional Peer-Reviewed Toxicity Values ("PPRTV") for TDCE through the inhalation route of exposure. The PPRTV identifies chronic and sub-chronic *inhalation* reference concentrations for TDCE of 40 and 400 µg/m^3, respectively, based on USEPA's review of inhalation toxicity studies and the agency's risk evaluation protocols. Based on this reference concentration, the USEPA published a Regional Screening Level ("RSL") for residential air of 42 µg/m^3 for TDCE. The residential RSL reflects a risk evaluation that includes sensitive populations.

As described further by Dr. Gray in **Exhibit 5**, the MDH's stated rationales for rejecting the PPRTV in favor of a site-specific RAA derived through RTR extrapolation are unfounded. In publishing the PPRTV, the USEPA concluded that the key inhalation study on which it was based was reliable. In any case, the USEPA's value is far more reliable than the MDH's RAA value derived in a closed-door RTR extrapolation, which, in addition to being inherently unreliable, was not peer-reviewed and does not appear to have followed established protocols. RTR extrapolation of an inhalation benchmark is inappropriate both on its own terms and especially given the existence of peer-reviewed inhalation studies and the USEPA's published PPRTV. The reference concentration and RSL for TDCE in residential air in the PPRTV were derived based on the available peer-reviewed inhalation studies of TDCE exposure. As a result, this is a far more reliable measure of inhalation risk than the MDH's RAA and is the only proper scientific and factual basis on which to set the TDCE limit in the Draft Permit.

[4] See, TSD, Minnesota Department of Health Memo from James Kelly to Kari Palmer dated July 13, 2022, at 5.

[5] Minnesota Department of Health, "Statement of Need and Reasonableness, proposed Permanent Rules Relating to Health Risk Values," at 10-11 (August 2001).

(b) Chronic vs. Sub-Chronic Benchmark

Separately from the oral versus inhalation issue, the 20 µg/m^3 RAA value used to form the basis of the TDCE limit in the Draft Permit is the MDH's *chronic* health benchmark for TDCE. As noted in the TSD and MDH guidance, the MDH defines chronic (long term) exposure as over a period of 10 percent of a lifespan, or approximately 8 years, while a sub-chronic exposure is anywhere from 30 days up to approximately 8 years.[6] According to the TSD, the MPCA's rationale for utilizing the chronic exposure benchmark in the RASS is that the chronic RAA "matches planned facility operation" because "the permit will be issued for Water Gremlin to operate into the future." The term of the Draft Permit is only 5 years and per the terms of the Draft Permit, it is subject to re-review, revised modeling and assessment upon renewal. Therefore, it is not possible for any individual to have a "chronic" (i.e., more than 8 years) exposure to TDCE during the term of the permit. Further, the MPCA does not allege that *any* residents in the area surrounding Water Gremlin's facility will have sustained chronic exposure to TDCE. The EPA's RSL for TDCE discussed above is based on an assumption of 24-hour exposure, for 350 days per year, for 26 years. This duration of exposure is not possible during the five-year term of the Draft Permit. Furthermore, the ambient air monitoring data collected by Water Gremlin for the last three years demonstrates that no off-site person will ever be continuously exposed, or even consistently exposed, to emissions from the Water Gremlin facility, if for no other reason, because of the variabilities of wind transport.

The TSD also notes that MPCA utilized the chronic health benchmark "in consideration to [sic] the extended prior unpermitted exposures of this community."[7] The Draft Permit and the supporting documents do not, however, allege (1) any prior unpermitted emissions of TDCE, or (2) any connection between historic TCE emissions and future TDCE emissions. In fact, the MDH admits that there is no known cumulative interaction between TDCE and prior TCE exposure, and toxicokinetically, there is no reason to believe that any effects of TDCE are cumulative of those with prior TCE exposure, because both TCE and TDCE are quickly eliminated from the body and do not bioaccumulate.

For these reasons, Water Gremlin believes that it is more appropriate to use the sub-chronic benchmark for TDCE, based on the USEPA's RSL as described above.

(c) Rounding of Endpoint Hazard Index

Water Gremlin objects to the MPCA's adjustment of the facility emission rate downward in Water Gremlin's Screening RASS so that the final endpoint-refined hazard index for TDCE calculates specifically to 1.00. In addition to evaluating individual emissions, the MPCA routinely calculates a facility-wide hazard index through the RASS, in which it assigns values to the

---

[6] Minnesota Department of Health, "Air Exposure Durations," (April 2020), https://www.health.state.mn.us/communities/environment/risk/docs/guidance/air/airdurations.pdf..

[7] TSD at 41.

hazards associated with each pollutant emitted to derive a total numeric value for the facility. This becomes the "Facility-wide Endpoint Hazard Index for the Facility," and can result in adjustments to emissions limits over-and-above those that would be allowed on a pollutant-by-pollutant basis. Minnesota Rule 4717.8600 describes the procedure for calculating a facility's hazard index. Subpart 2(D) states: "A hazard index of one or less indicates a combined concentration of chemicals unlikely to cause an adverse health effect to the general public." Because this is an inherently crude and overprotective exercise, the MPCA's normal process is to calculate to one significant digit. In practice, values between 1.01 and 1.49 round to 1, and values between 1.51 and 1.99 round up to 2. Water Gremlin's facility-wide endpoint hazard index, even using MDH's RAA, would round to 1, and at that level Water Gremlin's emissions limits would require no further adjustment. Under this calculation, Water Gremlin's facility-wide emissions limit for TDCE would have been 51.2 tpy.

MPCA departed from this practice in the case of Water Gremlin. MPCA refused to allow any rounding for a facility-wide Hazard Index, and furthermore applied a TDCE-specific endpoint hazard index of 1.0 (no rounding).[8] As a result, Water Gremlin's TDCE emissions limit was lowered to 38.7 tpy. MPCA's justification for this departure from its normal practice is that ambient monitoring at the Water Gremlin facility allegedly showed that the modeling was under-predicting air concentrations. This is incorrect. In fact, as discussed further below, Water Gremlin's ambient monitoring shows that TDCE concentrations (365-day rolling averages) have been consistently below the unpromulgated RAA level of 20 µg/m^3 for the past two years of monitoring.[9]

(d) Additional 16 Percent Safety Factor

After adjusting the RASS to reflect its rounding and TDCE-specific Endpoint Hazard Index decisions imposed on Water Gremlin, MPCA made a further reduction to its proposed TDCE limit, in an apparent attempt to calibrate the limit derived from its risk modeling procedure above (38.7 tpy) further downward by using the ambient monitoring data that had been generated over the prior two-plus years. That is, the ambient monitoring data showed a brief period (between approximately November 9, 2021 and January 8, 2022) wherein the 365-day

[8] TSD at 43.

[9] Despite a brief period where the 365-day rolling average for a single monitor (the agency does not use readings from all of the monitors) was calculated to be above 20.0 µg/m^3, the current individual 365-day rolling average is well below that level (14 µg/m^3 Monitor 2, period ending August 12, 2022). The other four monitors are all currently less than 10 µg/m^3 on a 365-day rolling average basis. Monitor 4 is typically the highest of the five monitors and its 365-day rolling average has been below 20 µg/m^3 since December 29, 2021. Notwithstanding the above noted results, the 365-day rolling average is not an appropriate time duration to compare against a chronic toxicity value. Note also that the monitor results likely reflect emissions from entities other than Water Gremlin. For example, the ambient monitoring detected TCE in air on several occasions after Water Gremlin discontinued its use and removed all TCE from its property, and a forensic analysis concluded that the TCE detections would not have been sourced from Water Gremlin. There are likely numerous other sources of chlorinated compounds in the area, but the MPCA attributes all monitored emissions (erroneously) to Water Gremlin. *See, e.g.,* Hazardous Waste licensees in the area in MPCA's 'What's In My Neighborhood' tool at: https://mpca.maps.arcgis.com/apps/webappviewer/index.html?id=9d45793c75644e05bac197525f633f87.

rolling mean TDCE concentration was in excess of MDH's RAA of 20 µg/m^3. MPCA paired the 365-day rolling VOC tracking required by the Administrative Order with this data and determined that the 365-day rolling emissions total, when the ambient monitors demonstrated a 365-day mean concentration above 20 µg/m^3 (November 9, 2021), was approximately 32.6 tpy VOCs (as of November 6, 2021). MPCA used this pairing to arrive at its adjusted TDCE limit of 32.6 tpy, citing the approximate 16 percent reduction (i.e., from 38.7 tpy to 32.6 tpy) as "appropriate based on the weight of the evidence provided by actual ambient air measured concentrations of t-DCE around the facility and the associated t-DCE usage at the facility." Water Gremlin has several objections to this adjustment.

The method used by MPCA is wholly arbitrary and amounts to an indefensible leap. There is no linear relationship or direct connection between TDCE usage (tons per year) and ambient concentration (micrograms per cubic meter). While partially dependent on emission levels, the concentrations observed at any one ambient monitor location or point in time are also a function of wind speed and direction for the time-period of interest. The inability to scale stack emissions directly to ambient concentrations is why risk modeling is normally conducted using a USEPA-approved dispersion model coupled with five years of National Weather Service hourly weather observations. The variability in weather patterns possible for a given area are deemed to be sufficiently represented by five years of representative hourly weather data. Using such data under MPCA's typical risk modeling procedures, the maximum calendar year average result for any one receptor in the grid (among hundreds or thousands) is then used as a surrogate for maximum exposure and limits are set on this basis.

MPCA's adjustment method is further cast into question due to other occasions whereby 365-day VOC usage levels in excess of 32.6 tpy resulted in 365-day rolling concentrations well below 20 µg/m^3 (e.g., Summer 2021, Summer 2022). Using MPCA's pairing method, one could infer that higher usage levels could be supported at different times of the year. This is not being proposed by Water Gremlin; instead, it simply shows that MPCA's arbitrary selection of one monitoring event to set an annual limit is not defensible.

MPCA states that it "must be noted that there are no other known sources of t-DCE around the Water Gremlin facility other than Water Gremlin itself." While none are known of, this does not negate the possibility that such sources exist in the area. For example, reviewing MPCA's 'What's In My Neighborhood' tool, various hazardous waste licensees are located in the region. It is certainly plausible that such businesses ceased usage of TCE under Minnesota's ban and found TDCE as an acceptable alternative based on prior guidance by MNTAP to businesses, in exactly the same manner as occurred with Water Gremlin. The MPCA's presumption that there are no other sources is therefore unsound.

3. Compounding Safety Factors Included in Proposed TDCE Limit

Water Gremlin believes it is important, in order to put these comments and the Company's TDCE emissions in context, to describe the many compounding safety factors that are incorporated the risk assessment process.

First, the USEPA's chronic oral reference dose for TDCE of 0.02 mg/kg-day includes an adjustment of the dose downward by the application of uncertainty factors to account for limitations in the database such as: inferring the effects of chronic exposure from a subchronic study; animal study to humans; variability and sensitivity of the human population; and number and quality of available studies. As a result, the USEPA's chronic oral reference dose of 0.02 mg/kg-day is **3,000 times LOWER** than the lowest exposure levels that produced a response in the experimental animals.

Second, in developing its RAA, the MDH did not use the 0.02 mg/kg-day oral reference dose from USEPA IRIS, but instead used a reference dose of 0.005 mg/kg-day, based on guidance from CalEPA. This is 4 times lower than the USEPA IRIS value.

Third, in the RAA, MDH relied on RTR extrapolation of oral to inhalation data, when EPA had already published a risk assessment not premised on RTR extrapolation. It isn't even clear that the agency considered the USEPA risk assessment data until Water Gremlin pointed it out in April of 2022.[10]

Fourth, the MPCA applied a chronic health benchmark value, which incorporates a safety factor of 10 times below the sub-chronic value.

Fifth, MPCA did not allow rounding of the Endpoint Hazard Index in the RASS, per past practice. This resulted in an additional 24 percent reduction in the overall facility TDCE limit (51.2 tpy to 38.7 tpy).

Sixth, the MPCA applied an additional 16 percent safety factor as described above.

In sum, under the agency's application, there is no objective probability of risk. Rather, there is simply and unfounded additive compounding of safety factors at all stages of the analysis, resulting in an overstated risk and unreasonable and unsupported limitations on the Water Gremlin operations.[11]

---

[10] The MDH RAA and MPCA risk assessment documentation was devoid of any discussion of the EPA's 2020 PPRTV, even though they try to backfill this gap in the MDH internal memo of July 13, 2022 provided as an attachment to the TSD. At best, this was agency oversight. We request that all records, notes, memoranda, e-mails, and other documentation in the files of the MPCA and MDH regarding the RAA and RASS be included in the permit record. This would include, but is not limited to, written or documentation oral communications, e-mails or other correspondence between MDH and/or MPCA and any other federal, state or local governmental agency or institution regarding the risk assessment for TDCE.

[11] While safety factors are used in the development of a regulatory threshold that are protective of health, they must be grounded in proper rulemaking and procedure involving all stakeholders. The use of large and arbitrary safety factors must be avoided. Otherwise, the result is an extrapolation that drives the risk threshold to overly protective threshold values devoid of any rational basis.

B. Monitoring Requirements

The Draft Permit imposes three levels of emissions monitoring for TDCE: (1) modeling inventory tracking and management of TDCE, (2) in-stack monitoring, and (3) ambient monitoring. In general, the MPCA's stated rationale for the ongoing monitoring requirements is that the facility is operating at or near the 20 µg/m^3 TDCE limit proposed in the Draft Permit, therefore additional monitoring is required to ensure there are no exceedances in the future. This rationale is not valid. The in-stack and ambient monitoring requirements are not required or necessary to demonstrate compliance. The Company has agreed to the MPCA's recommended gold standard of detailed inventory tracking and traceability of TDCE usage.

The in-stack monitoring serves no legitimate purpose, particularly in light of the high cost of this type of monitoring. Rather than accurately monitoring TDCE emissions, the in-stack continuous emissions monitoring system ("CEMS") measures total hydrocarbons, and attributes *any* molecules containing carbon toward a concentration as TDCE emitted. For this reason, the CEMS frequently overstates TDCE emissions.

By contrast, inventory tracking and management results in clear monitoring and record keeping of actual TDCE use and emissions, and is a standard compliance mechanism under the Clean Air Act.

The Draft Permit contains provisions for discontinuation of ambient VOC monitoring at Permit Item 5.1.57. However, this provision is unworkable for several reasons. First, the facility must continue ambient monitoring for at least 24 additional months once the permit is issued. Water Gremlin requested credit for having collected identical data for more than two years leading up to the Draft Permit term, but the agency denied this request. Second, in order to discontinue the ambient monitoring, Water Gremlin must be operating with TDCE emissions at least 80 percent of the permitted limit. It is counterintuitive and counterproductive to require a high level of solvent usage be maintained in order to discontinue ambient monitoring, when Water Gremlin has already proffered a schedule of TDCE emissions that would result in less TDCE emitted than under the Draft Permit. In the same vein, this requirement runs counter to Water Gremlin's stated intention and proposed authority under the Draft Permit to convert additional solvent-based coaters to UV-cured coaters, which have no TDCE emissions.

The ongoing monitoring requirements in the Draft Permit will create a compliance burden and significant added costs, with no additional benefit in terms of human health or agency oversight. We note that the original justification for in-stack VOC monitoring was due to concerns over TCE usage at Water Gremlin's facility. As noted above, Water Gremlin stopped using TCE more than three years ago. The facility has strict daily VOC reporting requirements tracked within production, which are used to model emissions consistent with MPCA and USEPA practice. This is the most reliable and traceable compliance monitoring point for all parties. In-stack monitoring does not provide specific emissions data usable for modeling or risk assessment purposes — the results are an inaccurate (total hydrocarbon) surrogate for TDCE emissions because all hydrocarbons within the stack are reported as TDCE, even those that are not TDCE.

Given the inherent unreliability, the other oversight and superior monitoring measures included in the Draft Permit, and the gap between actual emissions and the TDCE limit once the PPRTV and RSL are applied, there is no added benefit of in-stack or ambient monitoring and these requirements should be eliminated.[12]

C. Comments on Specific Provisions of the Preliminary Draft Permit and TSD

Water Gremlin has reviewed the Preliminary Draft Permit and TSD in detail and provides its additional comments in the attached **Exhibits 2-4**. We also incorporate by reference as part of the record in this matter Water Gremlin's prior comments and exhibits submitted to the MPCA on April 22, 2022. Additionally, Water Gremlin has been meeting with MPCA staff, at times on a weekly basis, and the summary notes, records, modeling data, communications and correspondence with the agency are incorporated herein by reference.

Water Gremlin notified the MPCA on August 4, 2022 about a small, existing wet cooling tower at Water Gremlin's South campus that was inadvertently missed in prior submittals. As discussed between MPCA and Stantec, this unit has been incorporated into the particulate modeling files and affected permit forms. Stantec will be submitting these items to the agency under separate cover today, August 19, 2022.

II. Water Gremlin Alternative TDCE Proposal

In discussions with the MPCA regarding the pre-publication version of the Draft Permit, and now again in these filed comments, Water Gremlin has proposed an alternative, enforceable, declining emissions schedule, that would result in a **net reduction** in emissions of TDCE over the five-year term of the permit and a permanent reduction should Water Gremlin seek to renew the permit. Water Gremlin's proffered emissions schedule was structured to provide for emissions of 38.7 tpy in year one of the permit (consistent with the MDH RAA guidance), and 36.5 tpy in years two and three of the permit, followed by reduced emissions of 19.4 tpy in years 4 and 5, which is well below the proposed limit in the Draft Permit. This proposal was specifically intended to facilitate Water Gremlin's transition to UV-based coating machines as part of its "Gremlin Green" environmental program, thereby **reducing** TDCE consumption well below even the erroneous risk levels used to establish the Draft Permit limits. The MPCA rejected this proposal, without a factual basis. Water Gremlin renews this requested adjustment to the permit limit for all of the reasons set forth in these comments, and in the Petition.

---

[12] As a further example of the MPCA's overreach on monitoring, the Draft Permit requires daily checks on the HEPA filters associated the Nederman collection units to be installed on future spray coaters (COMG 14). Water Gremlin contacted the manufacturer's representative who confirmed that such daily checks are not recommended or required, and in fact could lead to filter damage. Similar to the Nederman filters on the diecast machines, the Nederman collectors include pressure gauges that provide information on filter loaded and when filters should be changed. *See* a letter from Nederman representative on this issue attached as **Exhibit 6**.

III. Conclusion

On behalf of Water Gremlin, we appreciate the opportunity to provide comments on the Draft Permit. We reserve the right to request and incorporate the full record in this matter, including all documents, communications and materials of the MPCA, MDH, other state agencies and any third parties who worked on the Draft Permit, risk assessment, health benchmarks and related information. We request that the agency take appropriate steps to preserve and retain all such materials as part of the record, should any further proceedings be necessary.

Very truly yours,

MINNESOTA POLLUTION CONTROL AGENCY

In the Matter of Water Gremlin Company Draft Air Emission Permit No. 12300341-101	)	**Case No. _____**

Water Gremlin Company's Petition For A Contested Case Hearing Pursuant to Minn. Stat. Ch. 14 and Minn. R. 7000.1800 and 7000.1900

Commissioner Katrina Kessler
Minnesota Pollution Control Agency
520 Lafayette Road North
St. Paul, Minnesota 55155-4194

TO THE MINNESOTA POLLUTION CONTROL AGENCY:

Water Gremlin Company ("Water Gremlin"), by and through its undersigned counsel, hereby petitions the Minnesota Pollution Control Agency ("MPCA") for a contested case hearing pursuant to Minn. Stat. Ch. 14 and Minn. R. 7000.1800 and 7000.1900.

I. INTRODUCTION

1. Water Gremlin is the world's technological and market leader in the manufacture of lead battery terminals (used in most every car, truck, bus, recreational vehicle, industrial products and military equipment that incorporates a battery) and recreational fishing products.[1] The Company operates a 160,000 square foot manufacturing and warehousing facility at 4400 Otter Lake Road in White Bear Township (the "Facility"). The Facility is currently operating

[1] Water Gremlin uses recycled lead materials in its manufacturing process. This is lead material that would otherwise likely end up in a landfill, thus promoting recycled usage rather than disposal in keeping with the State's preferred waste management hierarchy. MN Stat. 115A.02.

under an air permit issued by the MPCA in 2006, as well as a March 1, 2019 Stipulation Agreement signed by Water Gremlin and the MPCA ("Stipulation Agreement") and a unilateral January 17, 2020 Administrative Order issued by the MPCA ("Administrative Order").

2. Water Gremlin filed an application for a Major Permit Amendment on October 23, 2018, and filed several rounds of supplemental information with the MPCA in the 2019-2022 time-period.

3. On July 20, 2022, the MPCA published a Preliminary Draft Air Emission Permit No. 12300341-101 ("Draft Permit") for public notice and comments. The Draft Permit and the accompanying Technical Support Document ("TSD") are together over 1,600 pages, and the MPCA has publicly stated its conclusion (well prior to any factual consideration of permit terms and conditions) that the agency intends to impose the most stringent permit possible.[2] This predicate instruction to staff (and we believe to the Minnesota Department of Health) led to a number of assumptions, misstatements and misapplication of facts in the Draft Permit. Among other things, the Draft Permit includes a Facility limit for annual emissions of the chemical *trans*-1,2-Dichloroethylene ("TDCE") of 32.6 tons per year. TDCE is an industrial solvent that Water Gremlin began using in 2019, based on the recommendations of the MPCA and the Minnesota Technical Assistance Program ("MNTAP") at the University of Minnesota, that TDCE was a safe and effective replacement for Water Gremlin's prior industrial solvent, trichloroethylene ("TCE").[3] TDCE is manufactured and widely used by some of Minnesota's

[2] Assistant Commissioner Craig McDonald's comments at a MPCA public meeting regarding Water Gremlin on December 10, 2020.

[3] Water Gremlin voluntarily agreed to change its operations to use TDCE, well before the state legislature enacted a law eliminating certain uses of TCE by companies operating in Minnesota per Minnesota Statutes, section 116.385.

largest companies and has never been classified as a hazardous air pollutant under the Clean Air Act.[4]

4. The MPCA calculated the 32.6 tons per year TDCE limit in the Draft Permit based on 2020 Risk Assessment Advice ("RAA") from the Minnesota Department of Health ("MDH"), which recommends a sub-chronic inhalation health benchmark for TDCE of 200 micrograms per cubic meter ($\mu g/m^3$), and a chronic inhalation health benchmark of 20 $\mu g/m^3$. This RAA has not been promulgated into state rule or peer reviewed, and neither Water Gremlin nor the public were afforded the opportunity to comment on the RAA before it was implemented in the Draft Permit. Importantly, the in-house MDH RAA is **not based on inhalation studies** (the exposure pathway applicable to Water Gremlin's permit), but instead is based on an ingestion-to-inhalation ("route-to-route" or "RTR") **extrapolation** of a chronic oral reference dose of TDCE developed by the State of California. Over the objections of Water Gremlin, the MDH and MPCA used this route-to-route extrapolated value rather than the United States Environmental Protection Agency's ("USEPA") 2020 published Provisional Peer-Reviewed Toxicity Value ("PPRTV") and associated Regional Screening Level ("RSL") for residential air, which is based on USEPA's review of inhalation toxicity studies and the agency's risk evaluation protocols.[5] As described further herein, MPCA used incorrect and unrepresentative factual data and applied that formulation in the Draft Permit for Water Gremlin.

5. Contrary to Minnesota Rules and agency guidance, the MPCA applied the MDH RAA *chronic* inhalation health benchmark for TDCE to determine the overall annual Facility

[4] *See* TDCE safety profile information such as that from 3M. 3M, "t-DCE: A safe, sustainable component in 3M Novec cleaning solutions," (June 2021), https://multimedia.3m.com/mws/media/811521O/trans-dce-trans-dichloroethylene.pdf. According to 3M, the safety profile of TDCE has been well characterized over the past 25 years.

[5] U.S. Environmental Protection Agency, "Provisional Peer-Reviewed Toxicity Values for *trans*-1,2,-Dichloroethylene," (Sept. 2020), https://cfpub.epa.gov/ncea/pprtv/recordisplay.cfm?deid=349934.

emissions limit in the Draft Permit, rather than the *sub-chronic* inhalation health benchmark. Under Minn. R. ch. 4717 and MDH guidance, air guidance values are developed to protect human health for a specific length of exposure. Sub-chronic exposure is defined as a period of more than 30 days, up to ten percent of a person's lifetime, or approximately eight years. In contrast, chronic exposure is an exposure over a period of greater than eight years, up to an entire lifetime.[6] MPCA's sole justification for applying the chronic exposure standard was Water Gremlin's historic use of TCE, and therefore the TCE-TDCE combination resulted in a chronic exposure duration. At the same time, however, MDH acknowledges that there is no known cumulative interaction between TDCE and prior TCE exposure.

6. Separately from the use of chronic exposure levels, the MPCA further adjusted the emission rate downward in Water Gremlin's Screening Risk Assessment Spreadsheet ("RASS"), so that the final endpoint-refined hazard index for TDCE calculates specifically to 1.00. The MPCA alleges that it was necessary due to the results of ambient monitoring for TDCE at the Facility. In fact, Water Gremlin's ambient monitoring shows that TDCE concentrations (365-day rolling averages) have been consistently below the unpromulgated RAA level of 20 $\mu g/m^3$ for the past two years of monitoring.[7]

---

[6] Minnesota Department of Health, "Air Exposure Durations," (April 2020), https://www.health.state.mn.us/communities/environment/risk/docs/guidance/air/airdurations.pdf.

[7] Despite a brief period where the 365-day rolling average for a single monitor (the agency does not use readings from all of the monitors) was calculated to be above 20.0 ug/m^3, the current individual 365-day rolling average is well below that level (14 ug/m^3 Monitor 2, period ending August 12, 2022). The other four monitors are all currently less than 10 ug/m^3 on a 365-day rolling average basis. Monitor 4 is typically the highest of the five monitors and its 365-day rolling average has been below 20 ug/m^3 since December 29, 2021. Notwithstanding the above noted results, the 365-day rolling average is not an appropriate time duration to compare against a chronic toxicity value. Note also that the monitor results likely reflect emissions from entities other than Water Gremlin. For example, the ambient monitoring detected TCE in air on several occasions after Water Gremlin discontinued its use and removed all TCE from its property, and a forensic analysis concluded that the TCE detections would not have been sourced from Water Gremlin. There are likely numerous other sources of chlorinated compounds in the area, but the MPCA attributes all monitored emissions (erroneously) to Water Gremlin. See, for example Hazardous Waste licensees in MPCA's 'What's In My Neighborhood' tool at

7. In addition to the above calculations, the MPCA reduced the Facility TDCE emissions limit in the Draft Permit by a further 16 percent based on the Facility's existing emissions, alleging that the modeling was under-predicting air concentrations. This is in spite of MPCA's requirement that Water Gremlin complete extensive modeling and maintain a strict tracking of all TDCE purchased and used at its facility. Water Gremlin disputes this claim, and there is a genuine issue of material fact as to whether the ambient air monitoring under-predicts air emissions at the Facility.[8]

8. The basis for Water Gremlin's petition is that the MPCA's proposed Facility limit for TDCE is without a factual foundation, was arbitrarily derived and is being applied to the Water Gremlin Facility using a combination of methods and factual conclusions that are contrary to MPCA and MDH regulations and guidance and the scientific record. Water Gremlin proposes to put forward experts and evidence demonstrating that the MPCA and MDH's TDCE value is improper and not supported by substantial evidence, including testimony from toxicologists and air emission modeling experts.[9]

9. In discussions with the MPCA regarding the pre-publication version of the Draft Permit, and now again in contemporaneously filed comments, Water Gremlin has proposed an

https://mpca.maps.arcgis.com/apps/webappviewer/index.html?id=9d45793c75644e05bac197525f633f87 (accessed Aug. 19, 2022).

[8] As the MPCA is fully aware, there are many reasons for ambient monitoring results to be higher or lower than modeled results, including for example, differences between modeled short-term weather conditions and actual weather conditions and/or contributions from sources beyond the facility. The data over the short term does not correlate to use of the 365-day rolling average monitoring data in the way presented by the MPCA. For example, the maximum 365-day rolling average from five monitors is currently 14.4 ug/m^3 (Monitor 4) for the period ending August 12, 2022. The 365-day total VOC usage for the same August 12, 2022 end date is 33.1 tons.

[9] Water Gremlin has engaged Dr. Deborah Gray as a consulting toxicologist. Dr. Gray's curriculum vitae was previously provided to the MPCA in prior comments on the Draft Permit submitted on April 22, 2022, which materials are incorporated herein by reference. Water Gremlin has also engaged modelling experts from Stantec, including Mr. Jared Anderson. Both Dr. Gray and Mr. Anderson would be expected to testify in the contested case proceeding.

alternative, enforceable, graduated emissions schedule, that would result in a **net reduction** in emissions of TDCE over the five-year term of the permit and a permanent reduction should Water Gremlin seek to renew the permit. Water Gremlin's proffered emissions schedule was structured to provide for emissions of 38.7 tpy and 36.5 tpy respectively for the first two years of the permit (but still within the MDH RAA guidance), followed by reduced emissions below the proposed permit limit for the remaining years and resulting in a net reduction of TDCE emissions over the five year permit term. This proposal was specifically directed to facilitate Water Gremlin's transition to ultraviolet-based coatings in its "Gremlin Green" environmental program, thereby **reducing** TDCE consumption well below even the erroneous risk levels used to establish the draft permit limits. The MPCA rejected the proposal, without a factual basis.

10. Lastly, the Draft Permit imposes three levels of TDCE monitoring. The second of these levels – in-stack monitoring – serves no factual purpose not already established by tracking of TDCE purchases and daily usage and ambient monitoring, and is not scientifically justified.

11. Pursuant to Minn. Stat. ch. 14 and Minn. R. ch. 7000, Water Gremlin therefore requests that a contested case hearing be held on the issues listed below.

II. ISSUES TO BE REVIEWED

12. Water Gremlin raises the following factual issues for review at the contested case hearing:

A. The scientific and factual justification for applying the MDH's RAA oral-to-inhalation extrapolated benchmark value to develop the Facility limit for TDCE emissions, rather than the USEPA's peer-reviewed inhalation PPRTV. This includes:

(1). Whether the MDH RAA is scientifically supportable; and

(2). Even if it is, whether the EPA PPRTV should take precedence as the more applicable, scientifically supported and justified, benchmark value.

B. The scientific and factual justification for using a chronic (i.e., lifetime) inhalation health benchmark for purposes of determining the Facility limit for TDCE emissions, based on prior TCE emissions.

C. The scientific justification for refusing to round Water Gremlin's final endpoint-refined hazard index for TDCE, consistent with MPCA policy in applying RASS evaluations.

D. The scientific and factual justification for adding an additional 16 percent safety factor to the facility TDCE limit, based on the alleged under-predicting of emissions by the ambient monitoring system.

E. The scientific and factual justification for rejecting Water Gremlin's proposed graduated, enforceable emissions reduction schedule.

F. The scientific and factual justification for continuing in-stack monitoring, in light of inventory controls, modeling, and ambient monitoring.

III. INTEREST OF THE PETITIONER

13. As the permit holder and applicant, Water Gremlin has a significant interest in obtaining a contested case hearing on the issues described above. The Facility TDCE emissions limit proposed in the Draft Permit would limit Water Gremlin's operations and its ability to serve its existing and future customers, and the ongoing monitoring requirements add significant cost to Water Gremlin, with no added benefit to the public.

IV. REASONS WHY A HEARING IS WARRANTED

A. There are Material Issues of Fact Regarding the Validity of the MDH RAA

14. The MDH based its initial 2020 RAA (MDH 2020a) on an oral-to-inhalation route-to-route conversion for TDCE, because at the time there was no EPA-approved reference concentration ("RfC") for TDCE. WG TSD Att. 9 at 5. The initial MDH RAA was extrapolated from the current (USEPA, 2010) oral reference dose (RfD) published on USEPA's Integrated Risk Information System (IRIS) webpage. *Id.* at 1. MDH updated its RAA later in 2020 (MDH 2020b), cutting the proposed limit in half, based on updated Benchmark Dose Software ("BMDS") modeling. *Id*. MDH asserts that in the absence of the RAA, Water Gremlin would

have been allowed to emit TCDE "without a tDCE protective air limit." *Id.* At the same time, "MDH acknowledges the limitations associated with RTR extrapolation." *Id.* at 5.

15. The MDH Air Toxicological Summary for: trans-1,2-dichloroethylene presents the equations they used to convert the CalEPA (2018) oral RfD to an air concentration. Although no appropriate references are cited for this conversion, MDH appears to have used a simplified formula and variable values from USEPA (1996) Soil Screening Guidance: Technical Background Document. Other than summarizing CalEPA's rationale for revising the TDCE oral RfD for California's Drinking Water Program, MDH does not explain what the acknowledged limitations of RTR extrapolation are, or what adjustments, if any, MDH made to account for those limitations. In addition, MDH's RTR extrapolation has not been peer-reviewed.

16. Water Gremlin will offer expert testimony by qualified toxicologists and witnesses, on the following methodological errors and limitations of the MDH RAA:

a. The Environmental Protection Agency very seldom engages in RTR extrapolation, because it is extremely difficult to perform such extrapolation reliably. The uncertainties associated with RTR extrapolation are often at least as great as the uncertainties, and magnify any limitations, associated with the underlying study on which the extrapolation is based.

b. To perform a reliable oral-to-inhalation RTR extrapolation, there must be both an in-depth *understanding* and an in-depth *explanation* of the relative toxicokinetics of the chemical administered through the oral and inhalation routes. MDH itself recognizes that sufficient toxicokinetic information must be available to support any attempted RTR

extrapolation.[10] This is explained in detail in (EPA 1996, *Soil Screening Guidance, Appendix B*; and EPA 1994, *Methods of Derivation if Inhalation Reference Concentrations and Applications of Inhalation Dosimetry*). MDH cites neither of the documents, nor any other resources regarding the protocols for performing RTR extrapolation. As a result, there is no evidence in the record by which to evaluate MDH's understanding of and adjustment for the relative toxicokinetics of TDCE for the oral and inhalation routes. They are nothing more than vague assertions about "marginal" similarities in the effects shown by the oral study relied on by MDH and the results of the inhalation study relied on by EPA. *See* WG Att. 9 at 6-7.

c. The RTR extrapolation was performed in-house by MDH, and no record of peer review by MDH staff or outside reviewers has been provided. The absence of external peer review does not provide confidence in the assumptions used by MDH in performing the RTR.

d. In addition to these specific problems with MDH's RAA, Water Gremlin will offer testimony on the significance that EPA did not do an RTR extrapolation for TDCE at any time during the period from 2010-2020, when there was no inhalation toxicity Reference Concentration available. The Shopp study relied on by MDH and other oral exposure studies were fully available during this period, and having an inhalation toxicity value would have been useful in a number of contexts. The fact that EPA did not

[10] Minnesota Department of Health, "Statement of Need and Reasonableness, proposed Permanent Rules Relating to Health Risk Values," at 10-11 (August 2001).

do an RTR extrapolation is strongly indicative that EPA did not believe one could be reliably performed for TDCE based on the study data and toxicokinetic information available.

e. For these reasons, Water Gremlin's toxicologist will testify that the MDH RAA does not provide a reliable basis on which to derive a permit limit for TDCE. In addition, a contested case is necessary to assist the MPCA in determining what protocols were employed to ensure the reliability of the MDH RAA, in the event that the MPCA intends to rely on the MDH RAA for establishing the Water Gremlin TDCE permit limits.

1. There are Material Issues of Fact As to Whether the EPA TDCE PPRTV Provides a Superior Benchmark for Setting Water Gremlin Permit Limits to the MDH RAA.

17. Independently of the unreliability of the MDH RAA, a more technically defensible inhalation toxicity benchmark is available. In September 2020, EPA established Provisional Peer-Reviewed Toxicity Values ("PPRTV") for TDCE through the inhalation route of exposure. The chronic inhalation PPRTV is 40 $\mu g/m^3$. MDH claims it considered and rejected the EPA PPRTV "when it was publicly released." WG TSD Att. 9 at 5. MDH rejected the EPA PPRTV in favor of its updated RAA derived from Cal-EPA's oral toxicity value using RTR.

18. MDH states four reasons for rejecting the EPA (2020) PPRTV:

a. The EPA (2020) PPRTV is based on a DuPont 1998 inhalation study, which EPA determined in 2010 was insufficient to establish an RfC, because of "toxicologically questionable endpoints." WG TSD Att. 9 at 5.

b. The DuPont 1998 study was not peer reviewed. *Id.*

c. *"*MDH considered the Shopp et al. 1985 drinking water study to be superior for tDCE as it reports on a specific challenge and response to the rodent

immune system and not just a standard blood count panel as in Dupont 1998." *Id.,* and

d. the drinking water pathway represents a more continuous internal exposure to the rodent rather than a six-hour episodic exposure occurring five days per week where recovery over 18-hour periods and weekends is likely." *Id.*

19. Water Gremlin's toxicologist and other witnesses will testify that none of these are satisfactory reasons for rejecting the EPA PPRTV in favor of the MDH RAA. Specifically:

a. The uncertainty regarding toxicological endpoints reported in the DuPont 1998 study was addressed in the 2020 EPA re-evaluation conducted to support derivation of an inhalation PPRTV. EPA resolved these issues by selecting the apparent dose-related critical effect from the DuPont study and applying updated BMDS software (in the same way that MDH applied updated BMDS software in re-evaluating the MDH RAA in 2020). In fact, EPA specifically concluded that the DuPont 1998 study met **all** the requirements for use in developing a provisional RfC, with the sole exception that the DuPont 1998 study was not peer-reviewed. Consequently, the 2020 inhalation PPRTV was designated as a screening level p-RfC.

b. Lack of peer review of the key study (DuPont 1998) relied upon by USEPA (2020) is not a valid reason for preferring the MDH RAA over the EPA PPRTV, because the MDH RAA is not itself peer-reviewed.

c. Any minor incremental value provided by the specific immune system challenge conducted in the Shopp study is overwhelmed by the limitations

and uncertainties associated with conversion of oral exposure to inhalation exposure. Throughout its memorandum, MDH compares and contrasts the underlying studies (Shopp 1985 oral and DuPont 1998 inhalation) without acknowledging that differences in study design and measures of effect do not detract from the DuPont study's direct relevance to deriving a RfC for inhalation of TDCE in ambient air and superior applicability to an inhalation exposure context.

d. MDH is correct that a drinking water exposure is a more continuous exposure than inhalation, but this is simply another example of the problems with RTR extrapolation. Inhalation toxicity values (RfCs and Inhalation Unit Risk Concentrations) are derived using assumptions that a person is continuously exposed to that concentration in air. No adjustments are made for intermittent exposures. No off-site person will ever be continuously exposed, or even consistently exposed, to emissions from the Water Gremlin facility, if for no other reason, because of the variabilities of wind transport. Regardless, the continuous exposure provided in the Shopp study is not an advantage of that study over the DuPont study, because inhalation results are adjusted to reflect an assumption of continuous exposure.

2. Even if route-to-route extrapolation were reliable, the MDH did not follow its own hierarchy of inhalation health benchmarks.

20. The TSD indicates that the MDH RAA of 20 $\mu g/m^3$ was used to determine the overall facility limit for TDCE based on a "hierarchy for toxicity value information sources" agreed upon by the MPCA and MDH. The TSD posits that because MDH toxicity values are first

in the hierarchy, the MPCA applied the MDH RAA value. This hierarchy is included in MPCA guidance on Air Emissions Risk Analysis published online[11] and is as follows:

1. MDH Health-Based Values and Risk Assessment Advice for Air
2. MDH Health Risk Values
3. USEPA Integrated Risk Information System ("IRIS")
4. California Environmental Protection Agency ("CalEPA") Reference Exposure Levels and Cancer Potency Values
5. PPRTVs derived by USEPA's Superfund Health Risk Technical Support Center (STSC) for the USEPA Superfund program

21. While an MDH RAA is higher in the benchmark hierarchy than USEPA IRIS and PPRTV values, the MDH itself did not follow the guidance hierarchy in developing its site-specific RAA for the Water Gremlin facility. Initially, in 2019, the MDH determined a chronic RAA value for TDCE of 70 $\mu g/m^3$, based on an RTR extrapolation of the chronic oral reference dose provided by USEPA IRIS. However, in 2020, the MDH discarded the USEPA IRIS chronic oral reference dose in favor of a chronic oral reference dose developed by CalEPA,[12] which ranks *lower* in the hierarchy than USEPA IRIS. MDH justified this departure based on CalEPA's criticisms of the USEPA RfD, but the mechanism for such review and adjustment is through the IRIS process, rather than selective reliance on lower-ranked benchmark sources. This is illustrative of the cherry-picking of data and methods exhibited by MDH throughout the Water Gremlin RAA process. In addition to the violation of MDH's own guidance, there is a material issue of fact as to whether

[11] Minnesota Department of Health, "Air Emissions Risk Analysis (AERA) Guidance," at 29 (Feb. 2019), https://www.pca.state.mn.us/sites/default/files/aq9-18.pdf.

[12] *See* Minnesota Department of Health, "Air Toxicological Summary for: trans-1,2-dichloroethylene," at 3 (May 2020), https://www.health.state.mn.us/communities/environment/risk/docs/guidance/air/tdcesumm.pdf.

the USEPA IRIS RfD is a more scientifically reliable standard than the CalEPA RfD, and Water Gremlin's toxicologist will testify why the USEPA IRIS RfD is factually best suited for the risk assessment.

3. MDH'S Qualitative Reasons for the RAA Standard are Not Scientifically Sound

22. MDH further justifies its RAA RTR extrapolation based on three qualitative factors:

a. The community near Water Gremlin was exposed to TCE emitted from the Water Gremlin facility for years prior to Water Gremlin's switch from TCE to TDCE, and the TDCE exposure may be cumulative of the TCE exposure because both are industrial chlorinated solvents, WG TSD Att. 9 at 5;

b. Covid-19 may exacerbate the effects to TDCE exposure, *Id.* at 7; and

c. Protection of public health is of the "utmost priority." *Id.* at 5.

23. There are material disputes of fact as to whether any of these are scientifically valid reasons to select the MDH RAA over the USEPA PPRTV. Specifically, Water Gremlin's toxicologist will testify:

a. MDH itself admits that there is no known interaction between TCE and TDCE exposure. ("The health effects of a chronic TCE exposure followed by tDCE exposure are unknown at this time." *Id.* at 7). Toxicokinetically, there is also no reason to believe that any effects of TDCE are cumulative of those with prior TCE exposure. Both TCE and TDCE are quickly eliminated from the body and do not bioaccumulate. MDH does not provide evidence that exposure to the low levels of TDCE measured in

ambient air at Water Gremlin's monitoring locations increases the inferred risk to the surrounding community. In fact, in their April 2022 Water Gremlin Public Health Assessment: Public Comment Draft, MDH concludes that "*past or current t-DCE…air emissions are not expected to harm people's health*."

b. MDH asserts that the RAA was released at a time when Minnesota was "besieged by Covid-19." *Id.* at 7. MDH is clearly justifying the RAA based on the uncertainty surrounding Covid-19 at that time, when vaccines and treatments for Covid-19 did not exist and there was great uncertainty about even the mechanisms of Covid-19 transmission. That uncertainty has since been much reduced through the developments of vaccines, treatments, and effective exposure controls. MDH also now admits that there is no known interaction between TDCE and Covid-19. *Id.* at 7. None of the studies referenced by MDH support such an inference. Furthermore, the studies referenced by MDH were available as of April 2022 when the Water Gremlin Public Health Assessment: Public Comment Draft was released, but were not cited in that document. It is therefore rank speculation for MDH to conclude that there would be any interaction between TDCE emissions in compliance with the EPA PPRTV and any incidence of Covid-19, and Water Gremlin's toxicologist will testify to that effect. MDH's invocation of its general interest in public health is not a scientifically valid reason to choose the MDH RAA over the EPA PPRTV. Public health is relevant to all chemical exposures and the

development of all RfC's, RfD's, and PPRTVs. MDH fails to acknowledge all the many uncertainty and protective adjustments that are incorporated as a matter of course in the development of any of these values. EPA follows a rigorous process to develop toxicity values. Once the key study and critical effect have been identified, a Point of Departure (POD) is determined for derivation of the RfD or RfC (for non-cancer health effects). Depending on the study design, particularly the number of dose levels evaluated, the POD is determined for a response that is different in exposed humans or animals compared to unexposed (control) subjects. In the case of TDCE, there were enough dose levels in the drinking water study by Shopp et al. 1985 and the inhalation study by DuPont 1998 for EPA to use Benchmark Dose Modeling Software (BMDS) to determine the POD. The POD dose is then adjusted downward by the application of uncertainty factors to account for limitations in the database such as: inferring the effects of chronic exposure from a subchronic study; extrapolating from an animal study to humans; variability and sensitivity of the human population; and number and quality of available studies. For TDCE, the chronic oral RfD and chronic screening level p-RfC are **3,000 times LOWER** than the lowest exposure levels that produced a response in the experimental animals.[13] The low RfD and RfC values are a function of the limited database and should not be interpreted to infer the toxicity of TDCE. Because the public health is

[13] *See* EPA PPRTV for TDCE at 43, Table A-2.

already a priority and was considered throughout the development of the EPA PPRTV, that priority does not provide an additional and independent qualitative reason to select the MDH RAA.

B. The MDH Improperly Applied a Chronic Inhalation Health Benchmark

24. The Draft Permit contains an enforceable limit of 32.6 tons per year of TDCE emissions, based on the MDH chronic inhalation RAA health benchmark of 20 $\mu g/m^3$. According to the TSD, the MPCA utilized the chronic health benchmark "in consideration to [sic] the extended prior unpermitted exposures of this community."[14] The Draft Permit and the supporting documents do not, however, allege (1) any prior unpermitted emissions of TDCE, or (2) any connection between historic TCE emissions and future TDCE emissions. In fact, the MDH admits that there is no known cumulative interaction between TDCE and prior TCE exposure. WG TSD Att. 9 at 7. Consequently, MPCA has not articulated a valid reason to apply a chronic standard over a subchronic standard.[15]

C. The MPCA Improperly Disallowed Rounding of the Endpoint Hazard Index

25. In addition to evaluating individual emissions, the MPCA routinely calculates a facility-wide hazard index through the RASS, in which it assigns values to the hazards associated with each pollutant emitted to derive a total numeric value for the facility. This becomes the "Facility-wide Endpoint Hazard Index for the Facility," and can result in adjustments to emissions limits over-and-above those that would be allowed on a pollutant-by-pollutant basis. Minn. Rules 4717.8600 describe the procedure for calculating a facility's hazard index. Subpart 2(D) states: "A hazard index of one or less indicates a combined concentration of chemicals

[14] TSD at 41.

[15] We note that Water Gremlin proposed a TDCE limit over the life of the permit that is well below any chronic or sub-chronic risk derivation, and this was rejected by the MPCA.

unlikely to cause an adverse health effect to the general public." Because this is an inherently crude and overprotective exercise, the MPCA's normal process is to calculate to one significant digit. In practice, values between 1.01 and 1.49 round to 1, values between 1.51 and 1.99 round up to 2. Water Gremlin's facility-wide endpoint hazard index, even using MDH's RAA, would round to 1, and at that level Water Gremlin's emissions limits would require no further adjustment. Water Gremlin's facility-wide emissions limit for TDCE would have been 51.2 tons per year.[16]

26. MPCA departed from this practice in the case of Water Gremlin. MPCA refused to allow any rounding for a facility-wide Hazard Index, and furthermore applied a TDCE-specific endpoint hazard index of 1.0 (no rounding).[17] As a result, Water Gremlin's TDCE emissions limit was preliminarily lowered to 38.7 tons/year.

27. MPCA's only justification for this change in protocol is the extent of Water Gremlin's historic emissions. This is not scientifically or factually justifiable, for the following reasons:

a. The facility-wide hazard index process is intended to address a facility's *prospective* emissions over a range of pollutants; there is no process, standards, or guidance for further adjusting the index on the basis of historic emissions. Should MPCA wish to add a historic-emissions adjustment to the index development process, it should develop a new rule

[16] This petition disputes the MPCA's factual underpinnings and basis for the limitations set forth in the Draft Permit. Under the MPCAs normal protocols using consistent applications of facts, science and law, Water Gremlin's permit limit would be no less than 51.2 tons per year. Notwithstanding, Water Gremlin has offered to voluntarily limit its TDCE usage (using the MDH RASS recommendation) and has agreed to a graduated reduction of TDCE emissions to less than 20 tpy during the life of the 5 year permit. Indeed, Water Gremlin's proposed usage of TDCE over the 5-year life of the permit is well below that allowed in the Draft Permit. See further discussion in text.

[17] TSD at 43.

or guidance to govern the RASS process. MPCA simply made up and applied such an adjustment to Water Gremlin by fiat.

b. The principal historic emissions of concern are for TCE, a chemical no longer in use at Water Gremlin. As previously explained, there is no scientific basis for adjusting the limits for TDCE emissions based on historic TCE emissions.

c. To the extent the MPCA relies on the historic emissions of other pollutants besides TCE for the departure from protocol, there is even less scientific basis for such an adjustment. The MPCA has not explained the toxicokinetic basis for an adjustment based on the historic emissions of any other pollutant by Water Gremlin, and Water Gremlin's toxicologist will testify that there is none.

D. The MPCA Improperly Added a 16 Percent Safety Factor to the Facility TDCE Limit

28. After adjusting the RASS to reflect its rounding and TDCE-specific endpoint hazard index decisions imposed on Water Gremlin, MPCA made a further reduction to its proposed limit, in an apparent attempt to calibrate the limit derived from its risk modeling procedure above (38.7 tons per year) further downward by using the ambient monitoring data that had been generated over the prior two-plus years.[18] That is, the ambient monitoring data showed only a brief period whereby the 365-day rolling mean concentration between approximately November 9, 2021 and January 8, 2022 (based on one monitor) was in excess of MDH's RAA of 20 $\mu g/m^3$. MPCA paired the 365-day rolling VOC tracking required by the Administrative Order with this data and determined that the 365-day rolling emissions total,

[18] TSD at 43.

when the ambient monitors demonstrated a 365-day mean concentration above 20 μg/m^3 (November 9, 2021), was approximately 32.6 tons per year VOCs (as of November 6, 2021). MPCA used this pairing to arrive at its adjusted TDCE limit of 32.6 tons per year, citing the approximate 16% reduction (i.e., from 38.7 tons per year to 32.6 tons per year) as "appropriate based on the weight of the evidence provided by actual ambient air measured concentrations of t-DCE around the facility and the associated t-DCE usage at the facility."[19] Water Gremlin has several objections to this adjustment:

a. The method used by MPCA is completely arbitrary and amounts to an indefensible leap. There is no linear relationship or direct connection between TDCE usage (tons per year) and ambient concentration (micrograms per cubic meter). While partially dependent on emission levels, the concentrations observed at any one ambient monitor location or point in time are also a function of wind speed and direction for the time-period of interest. The inability to scale stack emissions directly to ambient concentrations is why risk modeling is normally conducted using an EPA-approved dispersion model coupled with five years of NWS hourly weather observations. The variability in weather patterns possible for a given area are deemed to be sufficiently represented by five years of representative hourly weather data. Using such data under MPCA's typical risk modeling procedures, the maximum calendar year average result for any one receptor in the grid (among hundreds or thousands) is then used as a surrogate for maximum exposure and limits are set on this basis.

[19] TSD at 43-44.

b. MPCA's adjustment method is further cast into question due to other occasions whereby 365-day VOC usage levels in excess of 32.6 tons per year resulted in 365-day rolling concentrations well below 20 $\mu g/m^3$ (e.g., Summer 2021, Summer 2022). Using MPCA's pairing method, one could infer that higher usage levels could be supported at different times of the year. This is not being proposed by Water Gremlin; instead, it simply shows that MPCA's arbitrary selection of one monitoring event in November 2021 to set an annual limit is not mathematically defensible.

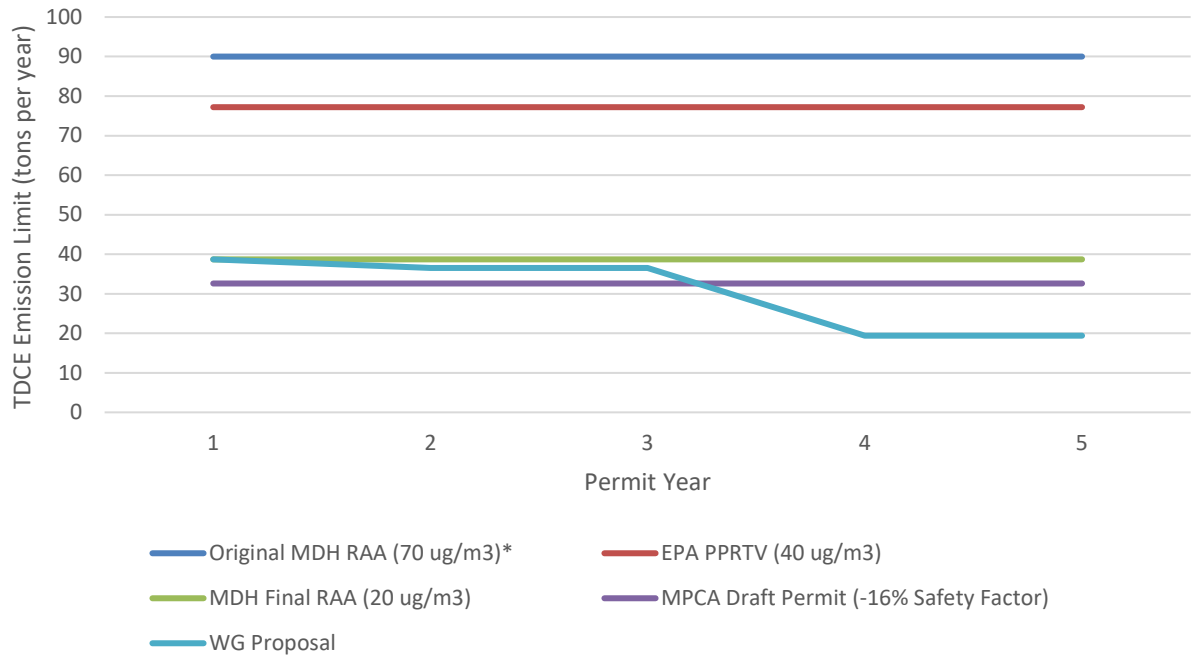
c. MPCA states that it "must be noted that there are no other known sources of t-DCE around the Water Gremlin facility other than Water Gremlin itself." While none are known of, this does not negate the possibility of such sources existing in the area. For example, reviewing MPCA's 'What's In My Neighborhood' tool, various hazardous waste licensees are located in the region. It is certainly plausible that such businesses (such as auto dealers, cleaners or others solvent users) ceased usage of TCE under Minnesota's ban and found TDCE as an acceptable alternative based on prior guidance by MNTAP to businesses, in exactly the same manner as occurred with Water Gremlin. The MPCA's presumption that there are no other sources is therefore unsound.

E. There are Material Disputes of Fact as to Whether Water Gremlin's Proposed Alternative TDCE Emissions Schedule is More Protective of Public Health Than the Emissions Limits in the Draft Permit.

29. As explained, there is no scientific justification for imposing a TDCE permit limit below the EPA PPRTV chronic inhalation standard of 40 $\mu g/m^3$, which translates to an annual tonnage limit of 77.2, or 38.6 tons over the five-year duration of the permit. Nevertheless, Water

Gremlin proposed to the MPCA that it would be prepared to accept a reduced emissions schedule as a binding term of the permit. The following figure provides a comparison of how the TDCE limit has been viewed, and how Water Gremlin's proposal is justified based on the science and facts, and results in reduced emissions over the life of the permit.

Figure 1: Comparison of Proposed Water Gremlin Facility TDCE Emissions Limits (tons per year)



* The original RAA of 70 µg/m^3 could have afforded TDCE usage up to proposed Total VOC minor source permit limit of 90 tons/year.

30. This Figure compares the total amount of TDCE allowed under the Draft Permit (163 tons based on 32.6 tpy for 5 years) verses Water Gremlin's proposal (see paragraph 9 above) that would actually reduce total emissions by over 12 tons over the life of the permit beyond what even the MPCA contends can be lawfully emitted. Thus, the Water Gremlin proposal would actually reduce allowable TDCE emissions by almost 50% by the end of the permit term (38.7 tpy down to 19.4 tpy), but this was rejected without any factual analysis or

consideration of risk reduction by the agency. There is no legal prohibition on providing for a graduated emissions schedule in a permit in lieu of the straight-line set of limits. MPCA nevertheless rejected Water Gremlin's proposed alternative emissions schedule. MPCA's sole rationale for rejecting the schedule was the contention that emissions can never be allowed to exceed the 32.6 ton annual limit derived from the MDH RAA. As explained in this petition, there is no scientific justification for this position and a contested proceeding is critical to help evaluate the facts for a fair and fully informed permit decision.

31. In addition, to the extent that the MPCA credits any of the MDH's stated qualitative reasons for the applying the MDH RAA (historic emissions of TCE, theorized interaction with Covid-19, and an over-riding priority to protect public health), then Water Gremlin's proposed emissions schedule is superior to that proposed in the Draft Permit. Water Gremlin's schedule would result in reduced net emissions, and would be more protective of the public health than the TDCE emissions limit in the Draft Permit. These benefits compound to the extent the permit extends beyond the initial 5-year term, as Water Gremlin would be emitting over 11 tons per year less of TDCE than under the Draft Permit conditions. Consequently, there is a disputed issue of material fact as to whether Water Gremlin's proposed alternative schedule is equally or more protective of public health that the limits in the Draft Permit, under the MPCA's own permitting assumptions.

F. There is No Scientific Justification for In-Stack Monitoring and the Provisions for Discontinuing Ambient Monitoring are Unworkable

32. The Draft Permit imposes three levels of emissions monitoring for TDCE: (1) inventory tracking and management of TDCE, (2) in-stack monitoring, and (3) ambient monitoring. The in-stack monitoring serves no legitimate purpose, and indeed confuses tracking of TDCE emissions because it measures Total Hydrocarbons and attributes any molecules

containing carbon toward a concentration as TDCE emitted.[20] Inventory tracking and management results in clear monitoring and record-keeping of actual TDCE use and emissions. Ambient monitoring is specific to TDCE, and demonstrates levels detected at the property line. Although ambient monitoring may be over-predictive of actual emissions from Water Gremlin because of potential off-site sources of TDCE, it provides an environmental "check" for actual emissions of TDCE, not Total Hydrocarbons.

33. In contrast, in-stack monitoring provides no additional information, and because the in-stack monitor only detects hydrocarbons, rather than TDCE, it frequently overstates TDCE emissions. More importantly, over three years of in-stack monitoring data have been collected. Water Gremlin first started operating its Total Hydrocarbon (THC) monitor on May 1, 2019 with evaluations required for each day in which coating operations were conducted. Under the terms of the January 17, 2020 Administrative Order, Water Gremlin was required to continue operation of this THC monitor. This monitoring data has never revealed any systemic issues with Water Gremlin's daily VOC/solvent usage tracking. With that extended dataset, and the inherent inaccuracy of the in-stack monitoring, in-stack monitoring confuses rather than illuminates emissions. Rather than discontinue in-stack monitoring started under the Administrative Order and instead rely on modeling as is typically done with permits, the MPCA instead proposes to increase the requirements by establishing daily reporting and auditing procedures. Recognizing the inaccuracy of the data, the MPCA attempts to correct for that by establishing "compliance bands" purporting to restrict the circumstances under which further auditing is necessary. But this attempted fix does not address the demonstrated fact that in-stack monitoring is less accurate than the dataset it is designed to check.

[20] TSD at 37.

34. In addition, Water Gremlin disputes whether the in-stack monitoring provides any useful information for maintaining compliance with the permit. Stantec witnesses will testify that the requirement provides no value, and a contested case is necessary resolve this issue.

35. The draft permit contains provisions for discontinuation of ambient VOC monitoring at Permit Item 5.1.57. The discontinuation provisions are unworkable as a practical matter, for the following reasons:

a. The facility must continue ambient monitoring for at least 24 additional months once the permit is issued. Water Gremlin inquired with MPCA staff about receiving credit for having collected identical data for over two years already and was denied. This is not equitable and there is no factual basis for MPCA's arbitrary decision.

b. Two paired provisions are also required to be satisfied in order for discontinuation of the ambient monitoring:

1. Water Gremlin must be operating with TDCE emissions at least 80 percent of the permitted limit. This is counter-intuitive and counterproductive to require a high level of solvent usage to discontinue ambient monitoring when Water Gremlin has already proffered a schedule of TDCE emissions that would result in lesser TDCE emitted under Water Gremlin's proposal than under MPCA's draft permit. The requirement also runs counter to the permittee's stated intention and proposed authority under the draft permit to convert additional solvent-based coaters to UV-cured coaters, having no TDCE emissions.

2. A novel test is prescribed for predicting whether future long-term average concentrations will be above health guidelines, specifically that the 95 percent upper confidence limit of ambient concentrations are below 80 percent of the MDH health benchmark limit, while simultaneously pre-conditioning high solvent usage under 1) above. This condition is not based on sound science.

V. RELIEF REQUESTED

36. For the foregoing reasons, Water Gremlin requests a contested case to ensure that the record is fully developed and to resolve the numerous material disputes of fact between the MPCA, MDH, and Water Gremlin.
