Composting won't solve any carbon problems if the methane is released. It seems unlikely gas from organic waste will be captured in sealed anaerobic composters. Perhaps the state should consider salted landfills for carbon capture and storage (CCS). The first link leads to a popular account of salted CCS; the second leads to an article from PNAS essentially stating the business case for such CCS.

Popular science article on salting and burying biomass for CCS

<https://news.berkeley.edu/2023/04/11/to-more-effectively-sequester-biomass-and-carbon-just-add-salt/>

Full article informing the above—complete business case
