

## Jean Ross

MPCA should protect low-sulfate waters. Many of Minnesota's most abundant wild rice stands in the Boundary Waters, the Lake Superior watershed, and north central Minnesota (including the Big Sandy Lake area) have far less than 10 ppm of sulfate. MPCA permitting should not allow sulfate in these wild rice waters to increase even if the degraded level of sulfate remains just below the standard. Sulfate pollution increases toxic mercury contamination of fish due to release of mercury from sediments and increased mercury methylation. MPCA must consider the effects of lax sulfate standard enforcement on mercury and methylmercury.

As you may know exposure to sulfate and mercury has negative health impacts. MPCA's lax enforcement of the wild rice sulfate standard and increased mercury contamination of fish will damage the developing brains of fetuses, infants, children, and people who rely on fish for subsistence, and will impair the exercise of tribal Treaty-reserved rights.
