

## Amy Crane

We are all part of this living miracle called Earth. We need to do our best to take care of it. I trust the Land Stewardship Project when they say manure management changes are needed. The Dead Zones at the end of major rivers around the world are largely caused by too much nitrogen from over fertilizing and runoff. These problems can be helped by not spreading manure from CAFOs during times and in places where it cannot be absorbed properly. No Brainer! Please listen to Land Stewardship Projects healing ideas that are based on evidence. These new strategies will lower the harmful effects of spreading too much nitrogen rich manure on our fields.

My grandparents were hog farmers back before animal confinements took over how we raise meat. Those hogs lived in open fields, had small huts and shade trees and room to breathe and run around. They felt the Earth. Do you?
