Matthew Lemke

My name is Matthew Lemke and I am writing on behalf of the City of Fergus Falls to provide comments on the Minnesota Pollution Control Agency's ("MPCA") proposed PFAS in biosolids strategy. The City of Fergus Falls is an owner and operator of a wastewater treatment facility with authorization to land apply our biosolids. Our biosolids are heavily regulated by EPA and MPCA and the land application of those biosolids is safe and environmentally beneficial. The City of Fergus Falls supports efforts to identify, reduce, and eliminate sources of PFAS to POTWs, but we are concerned that MPCA's proposed strategy is moving faster than what is currently allowed for by law and supported by final risk assessment data. However, as a local government entity, we also recognize that PFAS presents an important problem that needs to be strategically addressed in manner that prioritizes public health without imposing undue burdens on municipal wastewater treatment facilities. As a result, we recommend the following key changes to the proposed biosolids strategy:

• Changing the sample period for PFOS and PFOA data. Fergus Falls WWTP has limited storage capacity and having to wait at least two to four weeks before land applying is too restrictive and does not work in our overall operation of the facility. The current proposal would make us have to find additional storage for at least six weeks before being able to pump over additional treated biosolids to our reservoir as to keep the current representative sample. The new PFOS / PFOA sample requirement of waiting on results will not work in the overall operation of our biosolids program.

• The levels of PFOA and PFOS for the four tiers should be adjusted as follows: Tier 1 ($\leq 20 \mu g/kg$), Tier 2 (21-50 $\mu g/kg$), Tier 3 (51-125 $\mu g/kg$), and Tier 4 ($\geq 125 \mu g/kg$). We believe this slight adjustment will provide some additional flexibility and certainty—especially for those facilities that find themselves in tiers 1 and 2.

• The ban on land application of biosolids in the tier 4 category should be adjusted to a ban on new application sites only--with the potential to include additional requirements such as reduced application rates, and/or other risk mitigation strategies. A land application ban in the tier 4 category is premature both legally and scientifically without risk assessment data demonstrating that such an approach is necessary to protect human health. Outright bans on the land application or other beneficial reuse of biosolids—like what was enacted in Maine—have proven to be disastrous. The only exception to this should be in the unlikely event that the MPCA identifies, on a case-by-case basis, PFOA or PFOS in such high levels that there is an immediate and substantial threat to public health.

• MPCA's proposal to require a reduced application rate of 1.5 dry tons/acre in the tier 3 category is too rigid and it is not tied to any data demonstrating that it is necessary to protect human health. This reduced application rate is used in both the Wisconsin and Michigan strategies, but it is arbitrary and not based on risk assessment data for protecting human health and the environment and could cause significant problems for POTWs and farmers. To address these concerns, we suggest using a stated range from 1.5 to 3.5 dry/tons per acre and keeping the existing "or an

alternative risk mitigation strategy."

• The strategy should be voluntary, unless PFAS biosolids sampling indicates that there is immediate threat to public health on a case-by-case basis.

• To the extent available under law, MPCA should provide participants in the strategy liability assurances from future MPCA enforcement action related to the land application of biosolids.
