

Warren Johnson

I do not have a problem with holding mining operations accountable to environmental standards if these standards are using modern/current data. If anything over 10 parts per million per liter is damaging to the wild rice, prove it first. Maybe the limit is really 50 or 100 or 500. I believe that a 5 year independent study should be done and preformed by 3 different companies. During this 5 year study the mine should be allowed to operate. These are modern times, let's use modern data. It is too easy to cherry pick old data and close the mine down and stop hundreds of good paying jobs.
