

Blake Kolquist

Setting an unrealistic sulfate level to which bottled water doesn't pass the mustard speaks volumes to how insane this is. I've worked for almost 20 years in both mining and more recently in municipal water/wastewater. A "One size fits all" standard is illogical and irresponsible for something that simply hasn't been proven to date that negatively impacts every wild rice body of water. Do more science as we need common sense solutions that doesn't completely wreck both our industries and municipalities. Everyone is set to lose be it jobs, companies, industries, livelihoods and increased taxes for every customer that pays for wastewater from the mines down to the household.
