

Jim and Diane Schrack

We are providing public comment regarding the Ford Twin Cities Plant Area C Remediation Study.

Ford Area C, which is contaminated with long-buried toxic waste, sits next to the Mississippi River. Unless that waste is completely removed this site will always remain a dangerous and unsafe risk along the river— especially knowing that human beings and/or nature are involved.

All the toxic waste and debris needs to be removed and the site fully restored.
Alternative 6: Removal of all Wastes and Site Restoration is the only choice.

We've only got one Mississippi River.

Thank you.
