

Mike Denney

If there's a data center to be built close by, the treated water from the sewage treatment plant should be piped to the data center for it to use instead of groundwater. This is related to my earlier comment on why the capacity of this new treatment plant is over 3X the per person capacity of Rochester's. If it's to handle data center 'wastewater', the design is all wrong. The data center should be accepting clean water from the plant, not sending it wastewater.
