

ERIC GOLD

I support joining CARB and having it take effect immediately. This is decades late, but late is better than never.

Climate change is scientific fact, and the cost of each fossil kWh is in the range of \$100 - \$300 a ton of CO2. Any arguments about the cost of a transition to EVs and clean energy hurting the economy are completely missing the point that the cost of continuing fossil pollution is much, much higher to our communities.

PLEASE, do not let ignorance or the perverted, short term interest of a few individuals dictate the future of our state, country, and world.
