

Beverly Noel Chavez

I refuse to be forced to purchase an all-electric car. I do considerable driving and elec cars are not capable of going the miles I need on a charge. I live in a very rural area. I drive a hybrid to help reduce gas usage which should not be penalized. Same for a truck that pulls livestock. Also, doesn't it take fossil fuels to provide the reliable electricity needed for electric vehicles. What would the cost be to charge a vehicle every 200 miles on a 1200 mile trip? How much time and efficiency is lost to keep charging a vehicle? What would this do to small business trucking companies in NM? I'm all for environmental concerns and think these ideas should incorporate the needs of the majority. How do impoverished families afford these vehicles?
