New Mexico is not the market for EV's, lack of charging stations, lack of infrastructure to install more stations. We have long distances between most cities, with very hot summers, most EV's when running their A/C system, reduces their range and would not make it to their destination. Most of NM is rural and at or below poverty level, they can not afford an expensive EV as their only option. Also, there are very few certified EV technicians in NM and most technicians do not want to, and will not become certified for EV's.
