

Dean Kuethe

EVs burn natural gas with the same efficiency as a properly made gasoline car but entail much more destructive mining and fossil fuel to manufacture. In addition, the batteries are a toxic disposal problem. Currently, fossil fuel is burned to produce hydrogen. The myth of clean energy is an excuse for continued energy gluttony and subsidizes new harmful industries. To be kind to Mother Earth, require much less powerful vehicles. Switching to not-in-my-backyard engines is not responsible.
