

Cameron Zarrabzadeh

I am writing to formally record my strong opposition to the air quality construction permit application submitted by Yucca Growth Infrastructure, LLC for the "Project Jupiter" microgrid system. The New Mexico Environment Department must deny this permit based on the following critical concerns:

Severe Local Air Quality & Health Impacts: The massive fossil-fuel-powered microgrid required to sustain this facility will emit substantial amounts of carbon dioxide, nitrogen oxides (NOx), carbon monoxide, and particulate matter. Introducing these heavy industrial emissions directly threatens local air quality and poses immediate respiratory and long-term health risks to nearby frontline communities.

Extractive Economics for Out-of-State Tech Interests: This project represents an extractive economic model where New Mexico's critical infrastructure, environment, and public health are compromised to fuel data centers owned by out-of-state billionaire tech interests. The environmental burdens are localized heavily onto New Mexican residents, while the financial profits and technological benefits leave the state.

Compounding Environmental Strain: A project of this magnitude strains regional resources. Approving heavy industrial emissions to power a private tech infrastructure project contradicts the state's broader climate commitments and compromises the environmental well-being of the surrounding community.

I urge the Air Quality Bureau to prioritize public health, environmental justice, and the protection of New Mexico's air shed over the demands of outside corporate technology investments. Please deny the air quality permit for this project.
