I like the training aspect including prevention and intervention. Concerns! 1) I have concerns about providing temp structures on construction sites they become dangerous in sudden high wind situation. 2) a returning from a 1 week or more absence should be able to self declare that they have maintained acclimation. 3) The temp requirements should have a forced recognition in all public contracts " if heat indexes are exceeded and forces a work stoppage then additional days will be added to contract times. 4) waiver of noise ordinances should be automatic in public contracts to encourage night work during periods of high heat 5) placement of many different materials such as concrete or asphalt require periods of intense activity followed by lower intensity and are not suitable for breaks during these activities 6) the introduction of enclosed airconditioned structures would normally be powered by diesel or gas engines and result in air pollution . Note I'm 71 years old have been involved in outdoor construction since I was 18 and am very much aware of difficulties of working in hot environment strongly encourage training and planning discourage forced stoppage of work
