

Jeff Sims

Heat illness injuries are serious threats. Working in the heat can cause immediate problems like heat stroke or accidents, and it can lead to serious, long-term health problems with the heart, lungs, and kidneys. Heat can even cause death. It doesn't have to be over 100 degrees to be dangerous. Workers can get sick when it's in the 80s, especially if they don't have enough water, rest, or shade.

Please adopt the most rigorous standards possible.
