I am writing in support of EIB 25-11 (R) – Proposed New Regulation, 11.5.7 NMAC – Heat Illness and Injury Prevention. With rising temperatures and prolonged heat events in New Mexico, it is critical that we take proactive steps to safeguard the health and safety of workers—especially those in construction and outdoor environments.

This regulation reflects a growing recognition across the building industry that human health must be a central consideration. By incorporating elements found in frameworks like LEED—which emphasize comfort, safety, and resilience—this proposal helps ensure New Mexico is building smarter, safer, and more responsibly.
