

Gia morales

Project Jupiter will devastate our ecosystem and water supply. The creation of data centers hinders wildlife and the nature surrounding it. Data centers are not needed to sustain life--- water is. Taking up one of our most valuable resources to create a data center is harmful and unnessecary. The amount of toxic chemical pollutants that will be released by this data center will not only harm the surrounding nature, but is detrimental to people's health. Certain pollutants can cause asthma, respiratory issues, brain damage, several types of cancer, and death. The amount of hazardous waste being produced by this fuel cell plant such as benzene (a cancer-causing chemical), lead, arsenic, chromium (heavy metals), and sulfur, will seap into the soil, the water, and will reach human life leading to devastating outcomes. The eradication of Project Jupiter is necessary for the health and safety of the ecosystem and surrounding occupants of the designated building grounds. Stopping the creation of this data center now will prevent a domino effect of large unnessecary data centers being created, taking up our land, ecosystems, and right to fresh air and clean water. Stop Project Jupiter.
