

Sara Tubby

No community needs an ai data center, what a community does need is clean air and water. We have seen a surge of these data centers popping up all over the United States and we have seen the damage they've done to those around them as well as the livestock that we depend on as a food source. Every data center built strips acres and acres of land that could either support wildlife or be used to expand infrastructure within the community. The UN has warned us of the the environmental consequences of these data centers and yet, US politicians continue to sell out our country to these big tech companies against the will of their constituents. Every data center built has a cost to all of us, please consider the future of our children before constructing another one.
