

Jonathan Kohlhorst

I'd rather this project be put on hold until its environmental impacts can be properly assessed and the questions surrounding the project are answered clearly and in full. For instance, the hydrogen fuel cells for the center are projected to produce more greenhouse gases than our three largest cities combined, but the cells are instead touted as a clean alternative to gas turbines, downplaying their actual impact . The county vote was also seemingly rushed with little chance for public discussion and comment. This, combined with manufactured consent efforts observed here in Santa Fe, does not instill much confidence in any claims or promises made by the company. I am overall opposed to the data center's construction.
