

Catalia wood

I Catalia wood do not propose to the idea of having the world's largest data center here in New Mexico. New Mexico is already in a drought and building another data center that large isn't gonna help it. We lived without data centers for centuries why do we have 10x the amount of data centers as china? Do yall know that methane gas will be pumped into New Mexico air quality? New Mexico air quality is already bad enough but to add more problems into it is inhumane to the people living there and to the people who actually have a heart. Methane gas is pumped into fuel cells where it is baked at extremely high temperatures (around 1,470 °F) to make hydrogen for energy generation Produces the same massive amount of energy (2.46 GW) The public should be given an additional 60 days to review and comment on the air quality permit so community members can participate equitably. Say no to data centers protect our Earth and listen to the people.
