

Matthew Taylor

I do not want a data center in Santa Teresa.

The microgrids will emit nearly 500 tons per year of nitrogen oxides, an important ingredient in contributing to ozone. Individually, one microgrid is listed at 249.97 tons per year and the other at 248.9.

Project Jupiter could emit more than 14 million tons of greenhouse gases per year. By comparison, Albuquerque and Las Cruces emit a combined 6.7 million metric tons of greenhouse gases annually.
