

Samantha Montoya

I absolutely reject Project Jupiter. Project Jupiter will let out 10 million metric tons of carbon dioxide a year. More than any metro area in the state. At a time when climate change is affecting the world more than ever, this will have detrimental effects on public health and environmental consequences. New Mexicans know that we have limited resources as well. The Rio Grande has run dry this summer and we need water for the people and agricultural, not to cool down heat generated by the plant. Even if a system is generated with non potable water, the heat plume generated by the center will have a negative effect on an area that is easily passes 100 degrees a day during the summer.

Please reject Project Jupiter and support transparent sustainable projects that will support the community.
