

Ezra Giles

i might not live in the US, however im not an idiot. i can see what ai is doing to this planet and you can too. how can you see the fact that ai has. chat gpt uses around 10-25 milliliters per prompt, 57 million people submit an average of 5 prompts a day, you do the maths. 148 million liters of water PER DAY is being used. after doing some research, predictions indicate that ai-related data centres could consume over 1 trillion litres ANNUALLY by 2028. not only this, but you are trying to add a data centre into a place that ALREADY has bad air quality, if you add a data centre you are basically committing mass murder as the people will have no water and no clean air to live in. if you really sit there and think about it do you not truly fear how that will impact the rest of the world? sometimes i think people forget that we share our planet with so much amazing wildlife and animals that we need to strive to protect, not destroy. as a young person who is very passionate on this topic i believe we need to thrive to protect the world and all that comes with it instead of building unnecessary ai data centres. the future of our world depends on young people like me who are dedicated to stopping things like this from happening. we have to live in this world that YOU are actively trying to destroy. by the time us young people the same age as the people in charge of all these data centres, they will all be incapable of making decisions on things because they will be too old. so let me ask you this, why should the young people living in this world have to be responsible for cleaning up the mistakes of the generation before? there have been many PROVEN bad side affects of ai for the environment, all you have to do is research. thank you for reading.
